BETTER CARE MEANS GOING THAT EXTRA MILE.

From the moment patients arrive at The Mid-Atlantic Kidney Stone Center, we want them to feel comfortable and at ease. We begin by showing them a videotape explaining the lithotripsy treatment process, followed by a tour of our facility. Along the way we introduce them to the staff who will be providing their care.

We then make every effort to answer patient questions and address their concerns. Even though they are in our care for

just a few hours, we do our best to make the experience as pleasant as possible. Patients appreciate the personalized care at the Mid-Atlantic Kidney Stone Center.

In nearly two years of experience as a lithotripsy service, we have treated more than 2300 kidney stone patients from New Jersey, Eastern Pennsylvania, metropolitan New York and Del-

aware. We believe that our expertise makes us uniquely qualified to serve you and your patients.

If needed, we offer complimentary transportation and hotel accommodations for patients traveling to the Mid-Atlantic Kidney Stone Center. To find out more about our service, or how you can obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337. Outside of New Jersey, call (800) 53-LITHO.

On The Cover: Our review of some of the newer and more important aspects of facial cosmetic surgery begins on page 22. Cover illustration: Will Harmuth.

As long as medicine faces issues such as soaring malpractice insurance costs, there is a need for doctors to make "house calls" ... a phone call or letter to your government representative. Positive political action is often the only answer to onerous laws that impede the practice of medicine. New Jersey physicians are working to win malpractice insurance reforms under the leadership of the Medical Inter-Insurance Exchange. Sometimes old-fashioned "house calls" are a necessary part of modern medicine.

the Medical Inter-Insurance Exchange of New Jersey displays
medical journal ad urging New Jersey physicians
to contact their state officials.

HOUSE CALLS

Long backlogs of malpractice suits have made our malpractice insurance reforms in New Jersey life's most important decision. The kind that brought 400 trial lawyers to the State Supreme Court. But we need your help. We know your true responsibility is to your patients. Please make a difference by making a house call - a phone call to your state officials, without a visit.

LEGAL ADVISORY: DO NOT SPEAK TO INVESTIGATORS

It has been reported that investigators from the State Board of Medical Examiners are engaged in blatant misrepresentations to physicians in an effort to obtain information from them. An investigator recently attempted to obtain opinions from three Morris County physicians by lying to them and telling them that she was engaged in a survey. Fortunately, these physicians, all of whom are members of the Medical Society Endorsed Prepaid Legal Services Plan, contacted the program's attorney, Steven Kern, before speaking to the investigator. Mr. Kern was able to assess the problem and discover that the investigator was not involved in a survey, but rather in an investigation.

Had the physicians voluntarily answered the questions of this investigator, they would have found themselves in the middle of an investigation, the scope of which is not known.

This incident once again demonstrates the critical importance of contacting competent counsel prior to making any statements to an investigator or turning over any documents. The Medical Society Endorsed Prepaid Legal Services Plan is designed to provide expert legal counsel to handle just such situations. Members of that plan are urged to consult with a Plan attorney before meeting with any investigators. Those who are not members of the Plan should contact competent legal counsel or take steps to enroll, at their earliest opportunity, in the program. Membership applications for 1988 will be in the mail soon.

MEDICARE REIMBURSEMENT

Physicians can expect automatic cuts of 2.3 percent in their Medicare reimbursement unless Congress and the Administration agree on a budget reconciliation plan to pare the deficit by \$23 billion. If no budget reconciliation bill is signed into law or, if enacted, does not fully meet that budget reduction target, the Gramm-Rudman sequestration process goes into effect. Sequestration would achieve the additional savings needed to meet the \$23 billion target. Roughly equal automatic cuts in domestic and defense spending would be made if sequestration becomes necessary. Approximately \$1.5 billion in budget outlays would be pruned from the Medicare program. Two of the three

Congressional committees involved in health and the legislation reconciliation process—Senate Finance and House Ways and Means—have approved plans to satisfy the \$23 billion target through a combination of \$12 billion in new taxes and reductions in federal spending.

MEDICARE PART B COST CUTS

Faced with unrelenting political pressure to find ways of trimming future increases in Medicare Part B costs, HCFA now is pondering four new or rehearsed options for achieving that objective. The options are: 1) freezing Medicare payments for nonprimary care services; 2) further expanding utilization review activities to deny payments for "excessive, unnecessary and ineligible treatments" (HCFA already is planning to increase these activities by 40 percent to achieve savings of \$520 million); 3) expanding application of the "inherently reasonable" concept; and 4) encouraging patients, through reimbursement incentives and disincentives, to choose physicians HCFA has identified as having "sound practice patterns." Another concept being explored is the possibility of establishing specific Medicare spending targets by region or locality. Fees would be lowered when those targets were exceeded. Asked for his reaction to the various options, James S. Todd, M.D., AMA's Senior Deputy Executive Vice-President, said that HCFA "misunderstands what is driving health care costs today—the increasing number of elderly, the advancing age of the elderly, and the rapid development of new technology." Refinements of these cost-cutting approaches likely will be proposed in President Reagan's fiscal year 1989 budget, the AMA believes.

BREAST CANCER DIAGNOSIS

Despite mammography's usefulness in spotting early breast tumors too small to be felt by physical examination, no more than 25 percent of resulting surgical breast biopsies turn out to show cancerous lesions. But a report in the November *Archives of Surgery* says a new diagnostic technique, in which an x-ray-guided needle samples tumor cells for laboratory analysis, may reduce the need for many of these "open" biopsies. Kambiz Dowlatabadi, M.D., now of Rush Presbyterian-St. Luke's Medical Center, Chicago, and colleagues at the University of Chicago Pritzker School of

Medicine, used this technique, called stereotaxic fine-needle aspiration and cytologic analyses, to examine 84 women with abnormal mammograms. The researchers guided the sampling needle to within 1 to 2 mm of the suspected lesion in 80 cases and resulting cytologic analysis correctly identified 11 of 12 breast cancers (all cases were confirmed by standard biopsy).

"We expect that stereotaxic needle aspiration and cytologic analysis of mammographically detected breast lesions will reduce the need for breast biopsy, thus lowering the threshold of fear in women and indirectly encouraging them to participate more readily in regular screening programs," all the authors conclude.

SPECIAL REPORT: PLANNING YOUR FINANCIAL ROAD MAP

Ask an investor why he or she invests and the answer is likely to be, "To make money." A genuine financial plan, however, should go much further. People have individual financial needs that reflect specific goals and objectives; their financial plans should be tailored to meet those needs.

A useful way to establish investment objectives is to think of money as belonging to three categories: First, there's "absolute" money—what's needed for paying the bills; second, there's "old and grey" money—which is needed for a retirement nest egg; and then there's "discretionary" money—what's left after taking care of the necessities.

Each type of money serves a different purpose. Absolute money should be a certain money as risk free as possible. High yields cannot be expected. This money should also be subjected to the lowest possible volatility. That is, you want to avoid day-to-day price swings.

Short-term money market instruments are the most appropriate for this category. When money is invested for a few weeks or months, interest rate movements won't have a great impact during the holding period. The security will soon mature and return its principal. Treasury bills, backed by the U.S. government, fall into this category, as do many bank accounts, including short-term CDs and money market deposit accounts. They generally are insured by the federal government, up to a maximum of \$100,000. Money market mutual funds don't carry a federal guarantee, but they usually provide a slightly higher yield without any significant risk to principal.

Old and grey money also should be invested conservatively, but some risks might be taken to boost possible returns. The longer an investor has until retirement, the more volatility he or she will be able to tolerate. Over time, an investor is likely to ride out market cycles and earn a better return.

There is some leeway in investing old and grey money. To avoid risks, stay with short-term, fixed-income vehicles—bonds, notes, T-bills, and CDs. By maintaining maturities of six months or less, you'll have virtually as much safety as in your "absolute" money.

Stretching maturities a bit can enhance yield. The extra return may compensate for the risk of losing some principal. Rising interest rates devalue bonds and other fixed-income investments. The longer the bond's maturity, the greater the degree of volatility that is likely to be encountered. At present, it appears that investors who extend maturities to about seven years may receive yields commensurate with the extra risk.

For even higher yields, consider longer term bonds. If interest rates decline, your capital will appreciate. Of course, the converse also is true; if rates rise, you will be left with a capital loss.

Old and grey money may also include equities (stocks or stock funds) for investors willing to live with stock market volatility. Some investors will choose a "growth and income" approach, buying stocks that pay meaningful dividends. Not only is there a current income stream, but those dividends may increase over the years, thereby driving up stock values.

More aggressive investors often prefer to buy stocks strictly for growth. Their goal is capital appreciating rather than dividend income. The rise of the stock market during the past five years illustrates the potential rewards of following this strategy.

As for discretionary money, that's what it is—up to you. You can invest for growth or income. You can be conservative or speculative. Low-priced stocks, high-yield (junk) bonds, currency futures: if you want to take a flier with such investments, they belong in the discretionary sector of your portfolio. Often the most rewarding way for a busy investor to seek aggressive gains in the stock market is through mutual funds that strive for long-term appreciation.

Once the three types of investments are understood, an investor should be able to sit down with a professional money manager or financial adviser and write a road map: Here's where I am now, and here's where I want to go. The road map should have built-in milestones to help chart your path. At least once a year, you and your adviser should review your investment performance and re-examine your objectives.

Modifying your financial road map to account for changes both in your needs and in the economic environment is a natural and ongoing part of the process. It's better to make a series of small adjustments rather than large, abrupt changes. When you make a major shift in strategy, you're likely to be selling the wrong type of asset at the wrong time.

Risk, to an investor, is like stress to a patient. A certain amount is healthy because returns may be increased, but excess risk can be fatal. As we move from stage to stage in the life cycle, our propensity to take risks changes. Sometimes we want more comfort, sometimes less.

For example, a 45-year-old physician may be comfortable being aggressive with his pension fund investments. Short-term reversals won't be disastrous. Over the 20 or 30 years to retirement, he's likely to receive a higher yield in return for taking some risks.

A 65-year-old physician, on the other hand, probably

will be much more cautious with his pension plan. He'll be retiring soon, and he'll want to fix his retirement income with some certainty.

Each individual has unique needs, so he or she should have a unique investment plan. At first, a significant time commitment may be required to ensure that your financial planner fully understands your needs and objectives. Beware of planners who "plug you in" to their pre-set systems. You need a personalized plan, and the greater your involvement in the planning process, the better you'll be able to reach your objectives. Most investors will do best with a mix of money market, fixed-income, and equity investments. That mix should be constantly refined, in keeping with your changing goals.

John E. Turner
AMA Advisors, Inc.*

*AMA Advisors, the wholly-owned investment management subsidiary of the American Medical Association, recently has entered into a licensing agreement with the Medical Society of New Jersey. AMA Advisors offers physicians and other medical professionals a full array of mutual funds and financial services for retirement plans, IRAs, and personal investments. Some of the services they offer are: assistance with ERISA compliance, Asset Investment Management, and financial seminars to state and county medical societies. AMA Advisors has been managing mutual funds for more than 20 years and has a group of seasoned investment professionals managing the individual portfolios along with such industry professionals as: Templeton Investment Counsel, Inc., Oppenheimer Capital Corporation, Securities Counselors of Iowa, Inc., Payden & Rygel, and The Patterson Capital Corporation. For more complete information on The AMA Group, the funds managed by AMA Advisors, including charges and expenses, you may call for a prospectus by dialing toll-free anytime, 1-800-AMA-FUND (262-3863). Please read the prospectus carefully before you invest or send money.

FINI

"Don't worry about middle age—you'll outgrow it."

'The Power of the Pen'

When you decide to use Bactrim, use the power of the pen as well. It guarantees your patient will get Bactrim—with the power of penetration where you want it, the power of concentration where you want it, and the power to persist. Three powers well worth trusting.

And remember, after deciding on Bactrim, protect your decision. Take an extra half-second, in accordance with your state regulations, to prevent substitution.

SPECIFY.

Do not Substitute

Bactrim™ DS

(160 mg trimethoprim and 800 mg sulfamethoxazole/Roche)

Bactrim™ Pediatric

(40 mg trimethoprim and
200 mg sulfamethoxazole per 5 ml)

Please see summary of product information on following page.

Copyright © 1987 by Hoffmann-La Roche Inc. All rights reserved.

BACTRIM™ (trimethoprim and sulfamethoxazole/Roche)

Before prescribing, please consult complete product information, a summary of which follows:

CONTRAINDICATIONS: Hypersensitivity to trimethoprim or sulfonamides; documented megaloblastic anemia due to folate deficiency; pregnancy at term and during the nursing period; infants less than two months of age.

WARNINGS: FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS.

BACTRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. Clinical signs, such as rash, sore throat, fever, pallor, purpura or jaundice, may be early indications of serious reactions. In rare instances a skin rash may be followed by more severe reactions, such as Stevens-Johnson syndrome, toxic epidermal necrolysis, hepatic necrosis or serious blood disorder. Perform complete blood counts frequently.

BACTRIM SHOULD NOT BE USED IN THE TREATMENT OF STREPTOCOCCAL PHARYNGITIS. Clinical studies show that patients with group A β -hemolytic streptococcal tonsillopharyngitis have a greater incidence of bacteriologic failure when treated with Bactrim than with penicillin.

PRECAUTIONS: *General:* Give with caution to patients with impaired renal or hepatic function, possible folate deficiency (e.g., elderly, chronic alcoholics, patients on anticonvulsants, with malabsorption syndrome, or in malnutrition states) and severe allergies or bronchial asthma. In glucose-6-phosphate dehydrogenase deficient individuals, hemolysis may occur, frequently dose-related.

Use in the Elderly: May be increased risk of severe adverse reactions in elderly, particularly with complicating conditions, e.g., impaired kidney and/or liver function, concomitant use of other drugs. Severe skin reactions, generalized bone marrow suppression (see WARNINGS AND ADVERSE REACTIONS) or a specific decrease in platelets (with or without purpura) are most frequently reported severe adverse reactions in elderly. In those concurrently receiving certain diuretics, primarily thiazides, increased incidence of thrombocytopenia with purpura reported. Make appropriate dosage adjustments for patients with impaired kidney function (see DOSAGE AND ADMINISTRATION).

Use in the Treatment of Pneumocystis Carinii Pneumonitis in Patients with Acquired Immunodeficiency Syndrome (AIDS): Because of unique immune dysfunction, AIDS patients may not tolerate or respond to Bactrim in same manner as non-AIDS patients. Incidence of side effects, particularly rash, fever, leukopenia, with Bactrim in AIDS patients treated for *Pneumocystis carinii* pneumonitis reported to be greatly increased compared with incidence normally associated with Bactrim in non-AIDS patients.

Information for Patients: Instruct patients to maintain adequate fluid intake to prevent crystalluria and stone formation.

Laboratory Tests: Perform complete blood counts frequently, if a significant reduction in the count of any formed blood element is noted, discontinue Bactrim. Perform urinalyses with careful microscopic examination and renal function tests during therapy, particularly for patients with impaired renal function.

Drug Interactions: In elderly patients concurrently receiving certain diuretics, primarily thiazides, an increased incidence of thrombocytopenia with purpura has been reported. Bactrim may prolong the prothrombin time in patients who are receiving the anticoagulant warfarin. Keep this in mind when Bactrim is given to patients already on anticoagulant therapy and reassess coagulation time. Bactrim may inhibit the hepatic metabolism of phenytoin. Given at a common clinical dosage, it increased the phenytoin half-life by 39% and decreased the phenytoin metabolic clearance rate by 27%. When giving these drugs concurrently, be alert for possible excessive phenytoin effect. Sulfonamides can displace methotrexate from plasma protein binding sites, thus increasing free methotrexate concentrations.

Drug/Laboratory Test Interactions: Bactrim, specifically the trimethoprim component, can interfere with a serum methotrexate assay as determined by the competitive binding protein technique (CBPA) when a bacterial dihydrofolate reductase is used as the binding protein. No interference occurs if methotrexate is measured by a radioimmunoassay (RIA). The presence of trimethoprim and sulfamethoxazole may also interfere with the Jaffe alkaline picrate reaction assay for creatinine, resulting in overestimations of about 10% in the range of normal values.

Carcinogenesis, Mutagenesis, Impairment of Fertility: *Carcinogenesis:* Long-term studies in animals to evaluate carcinogenic potential not conducted with Bactrim. *Mutagenesis:* Bacterial mutagenic studies not performed with sulfamethoxazole and trimethoprim in combination. Trimethoprim demonstrated to be nonmutagenic in the Ames assay. No chromosomal damage observed in human leukocytes *in vitro* with sulfamethoxazole and trimethoprim alone or in combination; concentrations used exceeded blood levels of these compounds following therapy with Bactrim. Observations of leukocytes obtained from patients treated with Bactrim revealed no chromosomal abnormalities. *Impairment of Fertility:* No adverse effects on fertility or general reproductive performance observed in rats given oral dosages as high as 70 mg/kg/day trimethoprim plus 350 mg/kg/day sulfamethoxazole.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Trimethoprim and sulfamethoxazole may interfere with folate acid metabolism; use during pregnancy only if potential benefit justifies potential risk to fetus. Nonteratogenic Effects: See CONTRAINDICATIONS section.

Nursing Mothers: See CONTRAINDICATIONS section.

Pediatric Use: Not recommended for infants under two months (see INDICATIONS AND CONTRAINDICATIONS sections).

ADVERSE REACTIONS: Most common are gastrointestinal disturbances (nausea, vomiting, anorexia) and allergic skin reactions (such as rash and urticaria). **FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS (SEE WARNINGS SECTION).**

Hematology: Agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, neutropenia, hemolytic anemia, megaloblastic anemia, hypoprothrombinemia, methemoglobinemia, eosinophilia. *Allergic Reactions:* Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, allergic myocarditis, erythema multiforme, exfoliative dermatitis, angioedema, drug fever, chills, Henoch-Schoenlein purpura, serum sickness-like syndrome, generalized allergic reactions, generalized skin eruptions, photosensitivity, conjunctival and scleral injection, pruritus, urticaria and rash. *Periarteritis nodosa* and systemic lupus erythematosus have been reported. *Gastrointestinal:* Hepatitis (including cholestatic jaundice and hepatic necrosis), elevation of serum transaminase and bilirubin, pseudomembranous enterocolitis, pancreatitis, stomatitis, glossitis, nausea, emesis, abdominal pain, diarrhea, anorexia. *Genitourinary:* Renal failure, interstitial nephritis, BUN and serum creatinine elevation, toxic nephrosis with oliguria and anuria, crystalluria. *Neurologic:* Aseptic meningitis, convulsions, peripheral neuritis, ataxia, vertigo, tinnitus, headache.

Psychiatric: Hallucinations, depression, apathy, nervousness. *Endocrine:* Sulfonamides bear certain chemical similarities to some goitrogens, diuretics (acetazolamide and the thiazides) and oral hypoglycemic agents; cross-sensitivity may exist. Diuresis and hypoglycemia have occurred rarely in patients receiving sulfonamides. *Musculoskeletal:* Arthralgia, myalgia. *Miscellaneous:* Weakness, fatigue, insomnia.

DOSAGE AND ADMINISTRATION: Not recommended for use in infants less than two months of age.

URINARY TRACT INFECTIONS AND SHIGELLOSIS IN ADULTS AND CHILDREN, AND ACUTE OTITIS MEDIA IN CHILDREN: *Usual adult dosage* for urinary tract infections is one DS tablet, two tablets or four teaspoonfuls (20 ml) b.i.d. for 10 to 14 days. Use identical daily dosage for 5 days for shigellosis. *Recommended dosage for children* with urinary tract infections or acute otitis media is 8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses every 12 hours for 10 days. Use identical daily dosage for 5 days for shigellosis. *Renal Impaired:* Creatinine clearance above 30 ml/min, give usual dosage; 15-30 ml/min, give one-half the usual regimen; below 15 ml/min, use not recommended.

ACUTE EXACERBATIONS OF CHRONIC BRONCHITIS IN ADULTS: Usual adult dosage is one DS tablet, two tablets or four teasp.

PNEUMOCYSTIS CARINII PNEUMONITIS: Recommended dosage is 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

HOW SUPPLIED: *DS (double strength) Tablets* (160 mg trimethoprim and 800 mg sulfamethoxazole)—bottles of 100, 250 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 20. *Tablets* (80 mg trimethoprim and 400 mg sulfamethoxazole)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40. *Pediatric Suspension* (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 100 ml and 16 oz (1 pint). *Suspension* (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 16 oz (1 pint).

STORE TABLETS AT 15°-30°C (59°-86°F) IN A DRY PLACE PROTECTED FROM LIGHT. STORE SUSPENSIONS AT 15°-30°C (59°-86°F) PROTECTED FROM LIGHT.

Liability Risks and Costs

Liability Pressures in the Medical Group Setting; Doctor-Company Rate Hikes

MEDICAL GROUP LIABILITY PRESSURES

Do physicians in a group practice face a greater or lesser liability risk than solo practitioners? Some argue that there is safety in numbers and that in a multispecialty group practice referrals and communications among physicians are facilitated. In a single specialty group practice the ready availability of physicians to cover for each other is considered an advantage. A group practice may offer a broader range of expertise and ensure that the patient is followed by a physician who has access to the medical record when the primary physician is unavailable.

On the other hand, some observers believe that a group practice is a larger malpractice target with a deeper pocket. Many solo practitioners, mindful that they are completely responsible for the patient, contend that they are more cautious and protective of the patient than are physicians in a group practice in which the continuity of care is disrupted because the patient sees several physicians for one problem. The soloist maintains he has more freedom in selecting consultants and on-call physicians than the group practitioner, because he is not limited to the group.

Insurance company data comparing the claims frequency of group practices and solo practitioners do not conclusively indicate the relative exposure to or insulation from liability of each type of practice. In fact, experts believe it is not exposure, but rather how sound are its overall policies and procedures, including those pertaining to documentation and communication. The largest group practice can be just as safe as an attentive solo practitioner, and vice versa.

Consider these recommendations for reducing or eliminating some of the liability hazards associated with a group practice:

1. **Problem Lists.** Post a problem list on the inside

cover of each patient chart to indicate major medical problems and past surgical procedures. The list assists each physician in a group practice by providing an overview of all care, facilitates history taking, and alerts each practitioner that the medical chart contains examination details and progress notes from the patient's other physicians. A frequent deficiency associated with problem lists is their lack of completeness. Each entry must include the date of onset and, when appropriate, the date of resolution of listed problems. Simply noting a problem without indicating when it was resolved requires the current physician to search the chart for the information to ensure that the problem no longer is an issue.

2. **Separate Progress Note Sections.** In multispecialty groups, use a separate section for each medical service's progress notes to facilitate review of the records. If separate specialty sections are not practical, each progress note should clearly indicate the name of the treating physician and his or her specialty.

3. **Medications.** A substantial number of patient injuries and malpractice claims are associated with poor monitoring of medications and refills. Unless the patient's allergy history, current medication use, and refill record are available, oversights and errors may occur. Consider these safeguards:

- A. Affix a Medication Control Record (MCR) to the inside chart cover on which all medications prescribed are listed. The date, name of the drug, dose, number dispensed, instructions, and identity of the prescriber constitute one complete entry. Refills should be charted in a similar way and include the initials of the aide who phoned the pharmacy. Clearly indicate drug allergies at the top or on a colored label.

- B. Establish and follow a policy requiring each physician in the group to have the chart at hand to review the MCR before prescribing or authorizing refills for his or a colleague's patient. Set guidelines indicating when a colleague's patient must be seen before medication is prescribed or refilled.

- C. Establish and follow a policy which limits the amount of medication physicians in the group can refill for another's patient. Require each physician who prescribes or refills to annotate the MCR. No physician should prescribe or refill a medication with which he or she is unfamiliar or does not regularly prescribe.

- D. Do not permit unlicensed personnel, such as aides, secretaries, nurses, or technicians to prescribe or refill medications without a physician's specific approval. Although some may regard this policy as an inconvenience, it is a small one compared to the trauma of being sued and the risk of injuring a patient because due care was not taken. Aides, clerks, and other unlicensed staff cannot prescribe drugs.

- E. Consider a policy of not authorizing refills, except in very limited quantities, when the chart is not available. Inform patients of this policy in advance and explain how the policy protects them.

4. **Phone Calls.** All phone calls to or from patients in which important information is received or dispensed should be documented in the medical record.

Minnesota	+23		

*The Doctor's Company of California
(Percent changes sometimes represent
composites of several companies)

This includes phone reports to patients about laboratory and x-ray test results, appointment reminders, the physician's advice, or other significant information. Use a standard phone message slip, rather than odd slips of paper. Include the patient's complete name, date and time of call, and identity of the person who took the call. File the slips overlap style in the back of the chart in a separate section. In the progress notes, indicate the date and the letters "P.C.," which alerts other physicians that a phone message slip for that date is located in the reserved section. Physicians who take calls outside the office should complete a phone message slip for the chart.

5. **Quality Assurance.** A quality assurance program in a group practice is a safeguard against liability. While there is not space here to describe such programs in detail, two types of reviews are suggested: (1) monthly reviews of a random sample of charts by a quality assurance committee to evaluate appropriateness of care; and (2) concurrent documentation completion audits by trained assistants or nurses using criteria developed by physicians. (*Medical Liability Monitor*, September 23, 1987)

DOCTOR-COMPANIES RAISE RATES

The nation's physician-owned medical malpractice insurance companies posted another round of substantial rate increases in all but a handful of states during the last 18 months.

Medical Liability Monitor's 1987 Annual National Rate Survey of physician-owned companies, covering 32 of 39 insurers, confirmed overall increases ranging from a low of 7 percent in California to 99 percent in Utah. In spite of the huge percentage increase, Utah's current maximum annual premium for high-risk physicians at the \$1 million/\$3 million level is a modest \$41,979, compared to similar coverage for such physi-

*Medical Insurance Exchange of California.

cians in some other states.

The average increase for the reporting companies was 29.9 percent, which ultimately will add more than \$200 million in aggregate written premiums to the annual cost of health care.

The most expensive states for high-risk physicians—such as neurosurgeons and obstetricians—are Florida and New York where maximum annual premiums for \$1 million coverage have soared to well above the \$100,000 level. The most attractive rates are in Oklahoma where the maximum price for \$1 million protection is just \$11,393.

While premiums at the top of the scale can only be termed appalling, it remains that most of the nonsurgical practitioners in the country can still buy \$1 million coverage for \$10,000 or less.

A few states were cautiously optimistic about the future, reporting that the claims frequency appears to be leveling off and the most recent rate increases more modest than in past years. An early 1986 *Medical Liability Monitor* survey of companies indicated an average 38.1 percent projected increase in that year and *Medical Liability Monitor's* 1985 rate survey of 30 companies showed an average increase of 32.3 percent. There was an overwhelming consensus that without a surprise turn-around in the malpractice environment, the increasing severity of an average loss will push rates even higher in the years ahead. (*Medical Liability Monitor*, September 23, 1987, Vol. 12, No. 9)

Before prescribing, see complete prescribing information in SK&F LAB CO. literature or PDR. The following is a brief summary.

Contraindications: There are no known contraindications to the use of 'Tagamet'.

Precautions: While a weak antiandrogenic effect has been demonstrated in animals, 'Tagamet' has been shown to have no effect on spermatogenesis, sperm count, motility, morphology or in vitro fertilizing capacity in humans.

In a 24-month toxicity study in rats at dose levels approximately 9 to 56 times the recommended human dose, benign Leydig cell tumors were seen. These were common in both the treated and control groups, and the incidence became significantly higher only in the aged rats receiving 'Tagamet'.

Rare instances of cardiac arrhythmias and hypotension have been reported following the rapid administration of 'Tagamet' HCl (brand of cimetidine hydrochloride) injection by intravenous bolus.

Symptomatic response to 'Tagamet' therapy does not preclude the presence of a gastric malignancy. There have been rare reports of transient healing of gastric ulcers despite subsequently documented malignancy.

Reversible confusional states have been reported on occasion, predominantly in severely ill patients.

'Tagamet' has been reported to reduce the hepatic metabolism of warfarin-type anticoagulants, phenytoin, propranolol, chlorthalidone, diazepam, lidocaine, theophylline and metronidazole. Clinically significant effects have been reported with the warfarin anticoagulants; therefore, close monitoring of prothrombin time is recommended, and adjustment of the anticoagulant dose may be necessary when 'Tagamet' is administered concomitantly. Interaction with phenytoin, lidocaine and theophylline has also been reported to produce adverse clinical effects.

However, a crossover study in healthy subjects receiving either 'Tagamet' 300 mg. q.i.d. or 800 mg. h.s. concomitantly with a 300 mg. b.i.d. dosage of theophylline (Theo-Dur®, Key Pharmaceuticals, Inc.),

demonstrated less alteration in steady-state theophylline peak serum levels with the 800 mg. h.s. regimen, particularly in subjects aged 54 years and older. Data beyond ten days are not available. (Note: All patients receiving theophylline should be monitored appropriately, regardless of concomitant drug therapy.)

Lack of experience to date precludes recommending 'Tagamet' for use in pregnant patients, women of childbearing potential, nursing mothers or children under 16 unless anticipated benefits outweigh potential risks; generally, nursing should not be undertaken in patients taking the drug since cimetidine is secreted in human milk.

Adverse Reactions: Diarrhea, dizziness, somnolence, headache, rash. Reversible arthralgia, myalgia and exacerbation of joint symptoms in patients with preexisting arthritis have been reported. Reversible confusional states (e.g., mental confusion, agitation, psychosis, depression, anxiety, hallucinations, disorientation), predominantly in severely ill patients, have been reported. Gynecomastia and reversible impotence in patients with pathological hypersecretory disorders receiving 'Tagamet', particularly in high doses, for at least 12 months, have been reported. Reversible alopecia has been reported very rarely. Decreased white blood cell counts in 'Tagamet'-treated patients (approximately 1 per 100,000 patients), including agranulocytosis (approximately 3 per million patients), have been reported. Including a few reports of recurrence on rechallenge. Most of these reports were in patients who had serious concomitant illnesses and received drugs and/or treatment known to produce neutropenia. Thrombocytopenia (approximately 3 per million patients) and a few cases of aplastic anemia have also been reported. Increased serum transaminase and creatinine, as well as rare cases of fever, interstitial nephritis, urinary retention, pancreatitis and allergic reactions, including hypersensitivity vasculitis, have been reported. Reversible adverse hepatic effects, cholestatic or mixed cholestatic-hepatocellular in nature, have been reported rarely. Because of the predominance of cholestatic features, severe parenchymal injury is considered highly un-

likely. A single case of biopsy-proven periportal hepatic fibrosis in a patient receiving 'Tagamet' has been reported.

How Supplied: Tablets: 200 mg. tablets in bottles of 100; 300 mg. tablets in bottles of 100 and Single Unit Packages of 100 (intended for institutional use only); 400 mg. tablets in bottles of 60 and Single Unit Packages of 100 (intended for institutional use only); and 800 mg. Tiltab® tablets in bottles of 30 and Single Unit Packages of 100 (intended for institutional use only).

Liquid: 300 mg./5 ml., in 8 fl. oz. (237 ml.) amber glass bottles and in single-dose units (300 mg./5 ml.), in packages of 10 (intended for institutional use only).

Injections:

Vials: 300 mg./2 ml. in single-dose vials, in packages of 10 and 30, and in 8 ml. multiple-dose vials, in packages of 10 and 25.

Prefilled Syringes: 300 mg./2 ml. in single-dose prefilled disposable syringes.

Plastic Containers: 300 mg. in 50 ml. of 0.9% Sodium Chloride in single-dose plastic containers, in packages of 4 units. No preservative has been added.

ADD-Vantage® Vials: 300 mg./2 ml. in single-dose, ADD-Vantage® Vials, in packages of 25.

Exposure of the premixed product to excessive heat should be avoided. It is recommended the product be stored at controlled room temperature. Brief exposure up to 40°C does not adversely affect the premixed product.

'Tagamet' HCl (brand of cimetidine hydrochloride) Injection premixed in single-dose plastic containers is manufactured for SK&F Lab Co. by Travenol Laboratories, Inc., Deerfield, IL 60015.

* ADD-Vantage® is a trademark of Abbott Laboratories.

YOCON®

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

A Well-Read Journal

A readership survey proved NEW JERSEY MEDICINE is read by 95 percent of physicians in the Garden State.

We are proud of NEW JERSEY MEDICINE. And, we have reason to be. The results of the latest readership survey are in and—without a doubt—NEW JERSEY MEDICINE stands out above the crowd. We know you, our readers, have plenty of material to peruse, but it is a great feeling to know that every month you check in with us! NEW JERSEY MEDICINE participated in a readership study conducted by Health Industries Research of Wilton, Connecticut. This study sought two types of information: feedback for the editorial staff, and qualitative and quantitative measurements of interest levels and reading patterns to assist advertisers in their decisions to purchase state journal advertising space.

In conjunction with 11 other state medical societies—from large to small and from urban to rural—we took part in a “focus technique” readership study. This technique, perfected by Health Industries Research, measured how frequently and how thoroughly physicians read medical publications.

All state medical journals—without exception—are very well read. Data showed that nearly all physicians read at least one of every four issues, an indication for an advertiser of “total reach of a publication.” In general, all state journals studied had strong readership profiles (Table 1).

Our random sampling of readers—a healthy 68.8 percent—proved that NEW JERSEY MEDICINE is well read. Ninety-five percent of physicians in New Jersey read at least some issues and over half, 56 percent, read every issue of the state medical journal. Seventy-eight percent of physicians in the Garden State read an average issue (Table 2).

The editorial staff looked to this study to see what you, our readers, want. Firstly, 88 percent of our readership said they definitely want to continue receiving their copy of NEW JERSEY MEDICINE. Health Industries Research states that this statistic indicates a high level of satisfaction with our state medical journal. Most of the features of NEW JERSEY MEDICINE appeal to over 90 percent of our readers. Respondents were asked to express their interest level for some specific features in each issue:

Feature	Readership
Scientific Articles	94%
Professional Liability	
Commentary	94%
Membership Newsletter	87%
CME Calendar	64%
Book Reviews	55%

The completed study showed a good balance of interest in our selection of featured articles. With competition from major national medical and specialty

journals, our state medical publication "holds its own" in the eyes of New Jersey physicians. Additional written comments proved the statistics correct with statements like, "Keep up the good work" and "A good journal."

And, be assured, we are not going to rest on our

laurels. We plan to refer back to the survey and make our state journal a more effective instrument of communication. However, the individual opinions of our readers still remain paramount if *NEW JERSEY MEDICINE* is to be responsive to your needs. Write to us at any time and let us know your feelings. G.F.

Ulcer therapy that won't yield, even to smoking

YIELD

What do you do for duodenal ulcer patients who should stop smoking, but won't? Both cimetidine¹ and ranitidine² have been shown less effective in smokers than nonsmokers.

Choose CARAFATE® (sucralfate/Marion). Two recent studies show Carafate to be as effective in smokers as nonsmokers.^{3,4} A difference further illustrated in a 283-patient study comparing sucralfate to cimetidine⁵:

Ulcer healing rates:
(at four weeks of therapy)⁵

Sucralfate:

All patients	79.4%
Smokers	81.6%*

Cimetidine:

All patients	76.3%
Smokers	62.5%

*Significantly greater than cimetidine smoker group ($P < .05$).

Carafate has a unique, nonsystemic mode of action that enhances the body's own ulcer healing ability and protects the damaged mucosa from further injury.

When your ulcer patient is a smoker, prescribe the ulcer medication that won't go up in smoke: safe, nonsystemic Carafate.

Nothing works like

CARAFATE®
sucralfate/Marion

Please see adjoining page for references and brief summary of prescribing information.

CARAFATE® (sucralfate)

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that the simultaneous administration of CARAFATE with tetracycline, phenytoin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. The clinical significance of these animal studies is yet to be defined.

Carcinogenesis, Mutagenesis, Impairment of Fertility: No evidence of drug-related tumorigenicity was found in chronic oral toxicity studies of 24 months' duration conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies have not been conducted.

Pregnancy: Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients, adverse effects were reported in 121 (4.7%). Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm pink tablets are supplied in bottles of 100 and in Unit Dose Identification Paks of 100. The tablets are embossed with MARION/1712.

Issued 3/84

DRGs and New Jersey

The New Jersey Diagnosis Related Group program has been a matter of controversy from its inception.

The New Jersey Diagnosis Related Group (DRG) program has been, and continues to be, opposed to the DRG method of reimbursement because the Society views the program as fatally flawed. While the computer may "fit" the universe of patients into any one of the 467 DRG classifications, clinical realities make the concept unworkable.

It is difficult to measure the impact of such a program on patient care; however, it is commonly accepted that patients are being discharged "quicker and sicker." No matter which way the debate moves, it is readily acknowledged that patients are being discharged into an environment that clearly cannot meet their needs as ill or injured people needing time to heal.

The economic architects that devised and manage the system have not tolerated criticism very well. Their standard and only response is that such criticism is "anecdotal" and therefore nonmeritorious. As an attorney, I find that to be a rather amusing posture. In a court of law, the most valid evidence is considered to be direct testimony from a creditable eyewitness. I guess we will never overcome the carrier of perspective distortion. At a given point, however, it must be accepted that events do occur without being witnessed at the time or occurrence: leaves drop whether we see them or not.

The article by Professor Sapolsky (page 32) is the first indepth analysis of the New Jersey DRG program by an impartial and out-of-state researcher. He is one of the very few people that does not make the mistake of confusing our reimbursement statute (Chapter 83 of the Laws of 1987) with the requirement of a DRG methodology. The Medical Society of New Jersey has submitted three formal requests to the State Department of Health asking that an authoritative, out-of-state entity be commissioned to conduct an evaluation of the impact of the program on the quality of patient care. The Department has issued three declinations. Hopefully, Dr. Sapolsky's paper will stimulate debate and lead to further evaluation. This article is "must" reading for anyone concerned with hospital care in New Jersey.

Vincent A. Maressa
Executive Director
Medical Society of New Jersey

EDITOR. The Medical Society of New Jersey is accepting applications for the position of Editor of *NEW JERSEY MEDICINE*, the state medical journal. The Society's Executive Committee is seeking an experienced medical editor who can combine a strong scientific background with a keen interest and awareness of Medical Society affairs; an M.D. is required. The Editor is responsible for the editorial content of the monthly journal; the position is part-time. Please send a letter outlining your qualifications and a copy of your c.v. to the Executive Committee, MSNJ, Two Princess Road, Lawrenceville, NJ 08648.

LIBRIUM®

chlordiazepoxide HCl/Roche (V)

5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extropyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. **Oral—Adults:** Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. **Geriatric patients:** 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cards of 25, and in boxes containing 10 strips of 10. Libritabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

COSMETIC SURGERY OF THE FACE

ALVIN I. GLASGOLD, M.D., HIGHLAND PARK*

The increasing interest in facial cosmetic surgery is a trend that will continue. Keeping abreast of advances in this field can be difficult. This review will describe some of the newer and more important aspects of facial cosmetic surgery.

RHINOPLASTY

The "open approach" to rhinoplasty has added an exciting new dimension to an old operation. The exposure, utilizing a transcolumella incision followed by elevation of the nasal skin, allows for greater accuracy in correcting certain nasal deformities. The external scar is not a problem and this procedure has been a great help in dealing with difficult problems, specifically for the correction of the traumatized, twisted nose and the poorly defined broad tip, and for revision nasal surgery.

The advantage of the open approach is the greater exposure, visualization, and more accurate diagnosis. The structural defect can be corrected by trimming, repositioning, and cartilage grafting. The broad, flat tip now can be projected by using large cartilage struts sutured in position (Figures 1A and 1B).

Revision rhinoplasty always has been a dilemma for the nasal surgeon. A major disadvantage is undertaking a procedure in an already unhappy patient. As a result of scarring and other factors, achieving predictable improvement in revision surgery is difficult. Many capable surgeons have been reluctant to perform revision surgery which leaves an unhappy patient with no options. The open approach has allowed for more accurate correction of problems with a more predictable result.

*Dr. Glasgold is Associate Professor of Surgery, UMDNJ-Robert Wood Johnson Medical School, Piscataway. Correspondence may be addressed to Dr. Glasgold, 31 River Road, Highland Park, NJ 08904.

FACIAL CONTOUR SURGERY

In the past, rhinoplasty has been our major tool in changing facial outlines, but we now do facial contour surgery. Mentoplasty often was done as an associate procedure for micrognathia. We now work with our dental colleagues to realign the lower third of the face through orthodontics and mandibular repositioning. Newer techniques for midface surgery allow significant improvements in severe midface deformities. For the most part, however, we are dealing with less severe facial defects in cosmetic surgery. Malar, as well as mental, augmentation is being combined with other cosmetic procedures. Implantable prostheses placed through intraoral incisions or small external incisions improve facial appearance. The surgery is relatively simple, adds little operating time, and the prostheses are well tolerated. Complications such as infection and rejection are rare, as are shifting or asymmetric placement. Repositioning or removal and reinsertion of new implant may be accomplished without difficulty. Patient satisfaction has been great. Many patients request rhinoplasty, which alone would produce only slight improvement. Small recontouring procedures plus rhinoplasty often can change ordinary results into excellent results (Figures 2A and 2B).

Suction lipectomy, the newest addition to facial contouring, was first popularized in the United States by Newman and others.¹ The technique and instrumentation has been improved greatly during the past five years. In the face, it is used predominantly in the nasolabial folds, the jowls, and the submental region. Liposuction contouring of the nasolabial groove through intranasal incisions has limited value, but may be augmented by injecting filling material. Liposuction for the jowls and submental region through a small submental incision has been of f

Figure 1A—Traumatic nasal deformity. Note the asymmetry as well as the broad flat tip.

Figure 1B—Postoperative correction by open rhinoplasty.

Figure 2A—Preoperative view of patient who underwent revision rhinoplasty through open approach.

Figure 2B—Postoperative view of completed tip projection, with malar and mental augmentation and upper and lower lid blepharoplasty.

Figures 3A and 3B—Pre- and postoperative view of patient treated with facial liposuction in conjunction with facelift and augmentation of the malar and mental regions.

greater value, especially in the younger patient with good skin elasticity. As skin elasticity is lost, liposuction combined with facelift and/or mentoplasty compensates for skin laxity (Figures 3A and 3B). Facial liposuction alone or in combination with mentoplasty is a quick, very safe office procedure. The blunt cannula of the liposuction device is not likely to injure vessels or nerves. Liposuction with facelift has improved significantly the contouring effect in the jowl and submental regions and shortens operating time.

Facial contouring with injectable materials such as collagen Zyderm® and Zyplast® may produce excellent short-term results. Long-term results with injectable silicone have been more reliable, but the earlier use of injectable silicone produced significant problems. The material fell into disfavor and has not been approved by the FDA. Orentreich and others have shown silicone to be safe and effective when used appropriately, i.e. in very small quantities over a long period of time.^{2,3} Webster has written on the silicone microdroplet technique.^{4,5} Those familiar with silicone feel it is safe and provides excellent long-term results; they hope silicone

will gain FDA approval in the future.

Fat recycling involves the harvesting of fat by liposuction and reinjecting it to fill facial defects. Autogenous fat is a natural contour material and is easily obtained through small punctures under local anesthesia, but long-term fat survival with the present methods of recycling is questionable. Studies now are in progress on the basic nature of fat harvested from different areas of the body as well as the operative instrumentation.

Improved surgical techniques have reduced operating time, allowing performance of multiple procedures at one time, while advances in anesthesiology allow greater margin of safety with both general anesthesia and local anesthesia combined with intravenous sedation.

CONCLUSION

The challenge to improve facial appearance continues to advance our surgical skills. As a result, we are able to offer patients better results with less morbidity.

The World's Most Popular K^{*}

Slow-K[®]
potassium chloride
slow-release tablets
8 mEq (600 mg)

It means "dependability" in almost any language

*Based on worldwide sales data on file, CIBA Pharmaceutical Company.
Capsule or tablet slow-release potassium chloride preparations should be reserved for patients who cannot tolerate, refuse to take, or have compliance problems with liquid or effervescent potassium preparations because of reports of intestinal and gastric ulceration and bleeding with slow-release KCl preparations.

Before prescribing, please consult Brief Prescribing Information on next page.

The World's Most Popular K

For good reasons

- ❑ **It works**—a 12-year record of efficacy¹
- ❑ **It's safe**—unsurpassed by any other KCl tablet or capsule^{2*}
- ❑ **It's acceptable vs liquids**—greater palatability, fewer GI complaints, lower incidence of nausea²
- ❑ **It's comparable to 10 mEq**—in low-dosage supplementation^{3†}
- ❑ **It's economical**—less expensive than all other leading KCl slow-release supplements on a per tablet cost to the patient¹

Slow-K®
potassium chloride
slow-release tablets 8mEq (600mg)

For patients who can't or won't tolerate liquid KCl.

*The most common adverse reactions to potassium salts are gastrointestinal side effects.

†Pooled mean serum potassium following oral administration of 30 mEq K-Tab compared to 24 mEq Slow-K in diuretic-treated hypertensives (n = 20) over 8 weeks.

Slow-K®
potassium chloride USP
Slow-Release Tablets
8 mEq (600 mg)

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE INSERT)

INDICATIONS AND USAGE
BECAUSE OF REPORTS OF INTESTINAL AND GASTRIC ULCERATION AND BLEEDING WITH SLOW-RELEASE POTASSIUM CHLORIDE PREPARATIONS, THESE DRUGS SHOULD BE RESERVED FOR THOSE PATIENTS WHO CANNOT TOLERATE OR REFUSE TO TAKE LIQUID OR EFFERVESCENT POTASSIUM PREPARATIONS OR FOR PATIENTS IN WHOM THERE IS A PROBLEM OF COMPLIANCE WITH THESE PREPARATIONS.

1. For therapeutic use in patients with hypokalemia with or without metabolic alkalosis; in digitalis intoxication and in patients with hypokalemic familial periodic paralysis.
2. For prevention of potassium depletion when the dietary intake of potassium is inadequate in the following conditions: patients receiving digitalis and diuretics for congestive heart failure; hepatic cirrhosis with ascites; states of aldosterone excess with normal renal function; potassium-losing nephropathy; and certain diarrheal states.
3. The use of potassium salts in patients receiving diuretics for uncomplicated essential hypertension is often unnecessary when such patients have a normal dietary pattern. Serum potassium should be checked periodically, however, and if hypokalemia occurs, dietary supplementation with potassium-containing foods may be adequate to control milder cases. In more severe cases supplementation with potassium salts may be indicated.

CONTRAINDICATIONS

Potassium supplements are contraindicated in patients with hyperkalemia, since a further increase in serum potassium concentration in such patients can produce cardiac arrest. Hyperkalemia may complicate any of the following conditions: chronic renal failure, systemic acidosis such as diabetic acidosis, acute dehydration, extensive tissue breakdown as in severe burns, renal insufficiency, or the administration of a potassium-sparing diuretic (e.g., spironolactone, triamterene) (see OVERDOSAGE).

All solid dosage forms of potassium supplements are contraindicated in any patient in whom there is cause for arrest or delay in tablet passage through the gastrointestinal tract. In these instances, potassium supplementation should be with a liquid preparation. Wax-matrix potassium chloride preparations have produced esophageal ulceration in certain cardiac patients with esophageal compression due to an enlarged left atrium.

WARNINGS

Hyperkalemia (See OVERDOSAGE).

In patients with impaired mechanisms for excreting potassium, the administration of potassium salts can produce hyperkalemia and cardiac arrest. This occurs most commonly in patients given potassium by the intravenous route but may also occur in patients given potassium orally. Potentially fatal hyperkalemia can develop rapidly and be asymptomatic.

The use of potassium salts in patients with chronic renal disease, or any other condition which impairs potassium excretion, requires particularly careful monitoring of the serum potassium concentration and appropriate dosage adjustment.

Interaction With Potassium-Sparing Diuretics

Hypokalemia should not be treated by the concomitant administration of potassium salts and a potassium-sparing diuretic (e.g., spironolactone or triamterene), since the simultaneous administration of these agents can produce severe hyperkalemia.

Gastrointestinal Lesions

Potassium chloride tablets have produced stenotic and/or ulcerative lesions of the small bowel and deaths. These lesions are caused by a high localized concentration of potassium ion in the region of a rapidly dissolving tablet, which injures the bowel wall and thereby produces obstruction, hemorrhage, or perforation. Slow-K is a wax-matrix tablet formulated to provide a controlled rate of release of potassium chloride and thus to minimize the possibility of a high local concentration of potassium ion near the bowel wall. While the reported frequency of small-bowel lesions is much less with wax-matrix tablets (less than one per 100,000 patient-years) than with enteric-coated potassium chloride tablets (40-50 per 100,000 patient-years) cases associated with wax-matrix tablets have been reported both in foreign countries and in the United States. In addition, perhaps because the wax-matrix preparations are not enteric-coated and release potassium in the stomach, there have been reports of upper gastrointestinal bleeding associated with these products. The total number of gastrointestinal lesions remains approximately one per 100,000 patient-years. Slow-K should be discontinued immediately and the possibility of bowel obstruction or perforation considered if severe vomiting, abdominal pain, distention, or gastrointestinal bleeding occurs.

Metabolic Acidosis

Hypokalemia in patients with metabolic acidosis should be treated with an alkalinizing potassium salt such as potassium bicarbonate, potassium citrate, or potassium acetate.

PRECAUTIONS

General:

The diagnosis of potassium depletion is ordinarily made by demonstrating hypokalemia in a patient with a clinical history suggesting some cause for potassium depletion. In interpreting the serum potassium level, the physician should bear in mind that acute alkalosis per se can produce hypokalemia in the absence of a deficit in total body potassium, while acute acidosis per se can increase the serum potassium concentration into the normal range even in the presence of a reduced total body potassium.

Information for Patients

Physicians should consider reminding the patient of the following:
To take each dose without crushing, chewing, or sucking the tablets.
To take this medicine only as directed. This is especially important if the patient is also taking both diuretics and digitalis preparations.
To check with the physician if there is trouble swallowing tablets or if the tablets seem to stick in the throat.

To check with the doctor at once if tarry stools or other evidence of gastrointestinal bleeding is noticed.

Laboratory Tests

Repeat serum potassium determinations are recommended. In addition, during the treatment of potassium depletion, careful attention should be paid to acid-base balance, other serum electrolyte levels, the electrocardiogram, and the clinical status of the patient, particularly in the presence of cardiac disease, renal disease, or acidosis.

Drug Interactions

Potassium-sparing diuretics: see WARNINGS.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies in animals have not been performed.

Pregnancy Category C

Animal reproduction studies have not been conducted with Slow-K. It is also not known whether Slow-K can cause fetal harm when administered to a pregnant woman or can affect reproductive capacity. Slow-K should be given to a pregnant woman only if clearly needed.

Nursing Mothers

The normal potassium ion content of human milk is about 13 mEq/L. It is not known if Slow-K has an effect on this content. Caution should be exercised when Slow-K is administered to a nursing woman.

Pediatric Use

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

One of the most severe adverse effects is hyperkalemia (see CONTRAINDICATIONS, WARNINGS, and OVERDOSAGE). There also have been reports of upper and lower gastrointestinal conditions including obstruction, ulceration, and perforation (see CONTRAINDICATIONS and WARNINGS); other factors known to be associated with such conditions are present in many of these patients.

The most common adverse reactions to oral potassium salts are vomiting, abdominal discomfort, and diarrhea. These symptoms are irritation of the gastrointestinal tract and are best managed by taking doses with meals or reducing the dose.

Skin rash has been reported rarely.

OVERDOSAGE

The administration of oral potassium salts to persons with normal excretory mechanisms for potassium rarely causes serious hyperkalemia. However, excretory mechanisms are impaired or if potassium is administered rapidly intravenously, potentially fatal hyperkalemia can result (see CONTRAINDICATIONS and WARNINGS). It is important to recognize that hyperkalemia is usually asymptomatic and may be manifested only by increased serum potassium concentration (6.5-8.0 mEq/L) and characteristic electrocardiographic changes (peaking of T waves, loss of S-T segment, and prolongation of the Q-T interval). Manifestations include muscle paralysis and cardiovascular collapse, cardiac arrest (9-12 mEq/L).

Treatment measures for hyperkalemia include the following: (1) restriction of foods and medications containing potassium and of potassium-sparing diuretics; (2) intravenous administration of 300-500 mEq/hr dextrose solution containing 10-20 units of insulin per 1,000 ml; (3) treatment of acidosis, if present, with intravenous sodium bicarbonate; (4) exchange resins, hemodialysis, or peritoneal dialysis.

In treating hyperkalemia in patients who have been stabilized on a low potassium diet, too rapid a lowering of the serum potassium concentration can produce digitalis toxicity.

OSAGE AND ADMINISTRATION

The usual dietary intake of potassium by the average adult is 40-80 mEq/day. Potassium depletion sufficient to cause hypokalemia usually results in the loss of 200 or more mEq of potassium from the total body store. The dose must be adjusted to the individual needs of each patient but is typically in the range of 20 mEq per day for the prevention of hypokalemia to 40-100 mEq per day for the treatment of potassium depletion. Large numbers of tablets should be given in divided doses.

Note: Slow-K slow-release tablets must be swallowed whole and not crushed, chewed, or sucked.

HOW SUPPLIED

Tablets—600 mg of potassium chloride (equivalent to 8 mEq) round, white, sugar-coated (imprinted Slow-K).

Bottles of 100 NDC 0083-54

Bottles of 1000 NDC 0083-55

THE USE OF THE CARBON DIOXIDE LASER DURING LAPAROSCOPIC SURGERY

HERBERT A. GOLDFARB, (M.D., MONTCLAIR*)

Laparoscopy is a most useful means of evaluating the causes of pelvic pain and infertility. Since the introduction of the carbon dioxide laser laparoscope, these conditions can be treated laparoscopically. This procedure is suitable for all hospitals and surgical centers if used by trained surgeons.

The laparoscope is an invaluable tool, providing the gynecologist with a means of visualizing and diagnosing certain pelvic diseases or abnormalities without resorting to laparotomy. Adapted with cutting or electrocoagulating forceps, the laparoscope also can be used to carry out a variety of intra-abdominal surgical procedures. The most significant and promising adaptation of the laparoscope in recent years has been gynecologic laser surgery.

The laser laparoscope is designed to allow the passage of a single beam of light emitted from a carbon dioxide (CO₂) laser through a coupler attached to the operating channel of a specially designed laparoscope or to a second puncture probe. The beam of monochromatic light can be focused through the instrument's lens system and fired at the desired tissue with pinpoint precision.¹⁻³ The laser may reduce bleeding, operating time, tissue handling, postoperative adhesion formation, and patient recovery time.⁴

Since the laparoscope is employed routinely to diagnose infertility and pelvic pain, the availability of laser for use in conjunction with laparoscopy may afford the physician and patient an immediate, complete, and low-risk alternative to laparotomy or lengthy courses of drug therapy.

We conducted a retrospective review of the clinical records of 199 patients to assess the value of laser

equipment during routine laparoscopic procedures.

MATERIALS AND METHODS

The clinical records of 199 women admitted to the hospital between January 1, 1985, to May 31, 1987, for possible laser laparoscopy were reviewed retrospectively. The study included patients who were undergoing evaluation for infertility. The remaining patients underwent laparoscopy for the diagnosis and possible treatment of symptomatic pain or positive physical findings noted on physical examination, such as palpable masses or nodules. Prior to laparoscopy, each of these patients underwent a complete infertility study, which included semen analysis, postcoital testing, endometrial biopsy, basal body temperature recordings, and hormonal evaluation.

Written informed consent for laparoscopy and possible laser treatment was obtained from all patients. The procedure was performed under general endotracheal anesthesia with the 40-watt Sharplan 730 CO₂ laser,[†] the Wolf laser laparoscope,[°] the Wolf cin arc

°Richard Wolf Medical Instruments Corp., Rosemont, IL.

light source, and Stryker camera (tube type). The average power to lyse endometriotic implants ranged from 5 to 20 watts. Second and third suprapubic punctures were made as needed to properly isolate tissues for laser safety. A second puncture Wolf 300 mm laser delivery system with backstop and 200 mm laser spectrum delivery system were used when extensive adhesiolysis was performed. At the completion of the procedure, 60 cc of 32 percent dextran 70 was instilled in the abdominal cavity and the incision sutured. The average length of surgery ranged between 1.5 and 2 hours. A surgical assistant is available if laser therapy is required. Patients underwent laparoscopy the day of admission and remained in the hospital for overnight observation to rule out any postoperative complications.

RESULTS

Of the 199 women who underwent laparoscopy, 104 women (52 percent) were treated surgically with the CO₂ laser. Forty-seven of these patients underwent treatment at the time of laparoscopic diagnosis for infertility. The major finding among these patients was endometriosis. One of the patients treated had pelvic adhesions completely enveloping both ovaries; laser surgery freed one ovary and the homolateral tube and a successful pregnancy was achieved shortly thereafter. To date, 16 of the 47 (34 percent) infertility patients treated with the laser laparoscope have become pregnant. Most infertility patients had previous operative procedures. The most common finding among the noninfertility patients who underwent laser laparoscopy for pelvic pain also was endometriosis.

COMPLICATIONS

Over the course of two years and 104 laser laparoscopies, bleeding from the uterosacral ligament occurred in one patient and was the only major complication encountered. The bleeding affected vascular stability 12 hours after surgery, and required laparotomy and suturing of the uterosacral artery. The diagnosis was stage III endometriosis; pregnancy was achieved subsequently. Other complications included three cases of urinary retention secondary to lysis of en-

dometrial implants on the anterior bladder wall.

DISCUSSION

Laparoscopy currently is the second most frequently performed gynecological procedure, second only to curettage. It usually is performed for primary sterilization. A high percentage of women with pelvic pain but no obvious pathology, have significant findings at the time of laparotomy. In this study, 104 of the 199 women evaluated at the time of laparoscopy were judged to have pathology suitable for laser laparoscopic treatment.

The procedure for the laser laparoscopic surgery requires a second, and occasionally a third, puncture site. A Daniell laser spectrum second puncture delivery system was used during the early period of this study. A Wolf laser focusing cube was used during the latter phase of this study. The operating single puncture laser was considered sufficient for most procedures and could be manipulated with greater ease than the one described by Daniell.² The only limiting factor, of course, is the skill of the operator.

All procedures are viewed and recorded using a video camera which aids the laparoscopist in manipulating and fixing the tissues during surgery, and allows the patient to understand the course of treatment taken.

The laser laparoscope is fully approved by the FDA and represents a significant advance in the field of reproductive medicine. The laser laparoscope is a good choice for hospitals and surgical centers.

ANNOUNCING

NEW

KEFTABTM

cephalexin hydrochloride monohydrate

Dista Products Company
Division of Eli Lilly and Company
Indianapolis, Indiana 46285
Mfd by Eli Lilly Industries, Inc.
Carolina, Puerto Rico 00630

© 1987, DISTA PRODUCTS COMPANY KX-9008-B-849336

Computer-generated molecular
structure of cephalexin
hydrochloride monohydrate

Convenient 500-mg b.i.d. dosage and demonstrated effectiveness for treatment of:

- skin and skin structure infections*
- uncomplicated cystitis†
- pharyngitis‡

- New hydrochloride salt form of cephalexin—requires no conversion in the stomach before absorption

- Well-tolerated therapy

- May be taken without regard to meals

For other indicated infections, 250-mg tablets available
or q.i.d. dosage

Priced less than Keflex® (cephalexin)

Keftab is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-sensitive patients.

Penicillin is the drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever.

Due to susceptible strains of *Staphylococcus aureus* and/or β -hemolytic streptococci.
Due to susceptible strains of *Escherichia coli*, *Proteus mirabilis*, and *Klebsiella* sp.
Due to susceptible strains of group A β -hemolytic streptococci.

KEFTAB™

(cephalexin hydrochloride monohydrate)

Summary: Consult the package literature for prescribing information.

Indications and Usage:

Respiratory tract infections caused by susceptible strains of *Streptococcus pneumoniae* and group A β -hemolytic streptococci.

Skin and skin structure infections caused by susceptible strains of *Staphylococcus aureus* and/or β -hemolytic streptococci.

Bone infections caused by susceptible strains of *S aureus* and/or *Proteus mirabilis*.

Genitourinary tract infections, including acute prostatitis, caused by susceptible strains of *Escherichia coli*, *P mirabilis*, and *Klebsiella* sp.

Contraindication: Known allergy to cephalosporins.

Warnings: KEFTAB SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Keftab in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Keftab should be administered cautiously in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy and lactation. Cephalexin is excreted in mother's milk. Exercise caution in prescribing Keftab for these patients.
- Safety and effectiveness in children have not been established.

Adverse Reactions:

- *Gastrointestinal*, including diarrhea and, rarely, nausea and vomiting. Transient hepatitis and cholestatic jaundice have been reported rarely.
- *Hypersensitivity* in the form of rash, urticaria, angioedema, and, rarely, erythema multiforme, Stevens-Johnson syndrome, or toxic epidermal necrolysis.
- *Anaphylaxis* has been reported.
- *Other reactions* have included genital/anal pruritus, genital moniliasis, vaginitis/vaginal discharge, dizziness, fatigue, headache, eosinophilia, neutropenia, and thrombocytopenia; reversible interstitial nephritis has been reported rarely.
- Cephalosporins have been implicated in triggering seizures, particularly in patients with renal impairment.
- *Abnormalities in laboratory test results* included slight elevations in aspartate aminotransferase (AST, SGOT) and alanine aminotransferase (ALT, SGPT). False-positive reactions for glucose in the urine may occur with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (Glucose Enzymatic Test Strip, USP, Lilly).

AN EVALUATION OF THE NEW JERSEY DRG HOSPITAL PAYMENT SYSTEM

HARVEY M. SAPOLSKY, (PH.D., CAMBRIDGE, MASSACHUSETTS*)

The benefits and limitations of the New Jersey all-payer hospital reimbursement system are described, with emphasis on Diagnosis Related Groups (DRGs). Implementation problems and other areas of concern are noted as are multiple and conflicting goals of health policy that constrain governmental action.

In 1980, New Jersey introduced a new system for reimbursing hospitals utilizing the Diagnosis Related Group (DRG) method for determining rates. The state was the first in the nation to adopt this approach for hospital payment. In 1983, the federal government required the use of a modified version of DRGs for its Medicare program. Subsequently, the Robert Wood Johnson Foundation commissioned an evaluation of the New Jersey experience with the DRG payment system.¹ Here, I summarize the main findings and conclusions of the evaluation.

An important distinction needs to be made between hospital reimbursement reform in New Jersey and the selection of DRGs as the payment methodology. Senate Bill 446, the reform legislation enacted in 1978, was intended primarily to address two problems.¹ One problem was growth of bad debt that was threatening the financial viability of inner-city hospitals which served a large portion of the Medicaid and uninsured populations in the state. The other problem was the increasing differential that was developing between regulated Blue Cross rates and the uncontrolled charges that private insurers and individuals had to pay. The solution was to discard the then existing rate regulation scheme known as SHARE which regulated only Blue Cross and Medicaid rates for an all-payer arrangement which actually would share reimburse-

ment burdens equitably among all who paid for hospital services.² Under the all-payer arrangement implemented, Medicare and Blue Cross absorbed a portion of the bad debts hospitals incurred and the rate differential between Blue Cross and private insurers was much reduced.

The New Jersey approach to hospital payment stands in contrast to current national policy, which is best described as a "beggar thy neighbor" strategy. The federal government, wishing to hold down its own costs, limits Medicare payments to predetermined rates. Hospitals, not fully reimbursed for care provided, seek to avoid losses by shifting costs to private payers. Powerful private purchasers attempt to protect themselves from this cost shifting by demanding discount

*Dr. Sapolsky is Professor of Public Policy and Organization at the Massachusetts Institute of Technology. Correspondence may be addressed to Dr. Sapolsky, E53-467, Massachusetts Institute of Technology, Cambridge, MA 02139.

¹The project team was composed of Sanford Weiner, James Maxwell, and Dr. Sapolsky from MIT and William Hsiao and Daniel Dunn from the Harvard School of Public Health. Collaborators included James Aisenberg of the Harvard Medical School, Stan Finkelstein of MIT, James Morone of Brown University, and Richard Greene of the Veterans Administration. None of these individuals or organizations or the Robert Wood Johnson Foundation are responsible for any finding or conclusion reported here. The author thanks the Foundation for its support.

In turn, this places further burdens on those payers who lack market power and those hospitals that lack a large clientele of well-insured patients. As a result, problems that were addressed in the 1978 New Jersey reform of hospital reimbursement are growing in importance nationally. Hospitals that treat a disproportionate share of uninsured or underinsured patients are experiencing increased operating losses and the differential in rates paid by insurers is increasing due to discounting.³

The New Jersey approach has much to commend it. The all-payer arrangement guarantees both the financial solvency of New Jersey hospitals and the access to hospital care for all residents of the state without forcing particular classes of insurers to absorb alone the costs of these regulatory requirements. Instead, the costs of protecting hospitals and individuals are distributed via a negotiated formula among all those who finance hospital care within the state. The federal officials, concerned with the budget deficit, have chosen a different path, one which emphasizes limits on federal expenditures rather than provider solvency or increased patient access. Because of this, the renewal of the special waiver of standard federal procedures that permits Medicare to participate in the New Jersey all-payer arrangement stands in jeopardy.⁴

DRG: SELECTION AND IMPACT

Senate Bill 446 mandated that reimbursement be made utilizing a system that recognized case-mix variations among hospitals, but did not specify the methodology to be used by the State Department of Health in implementing the law.⁵ The Department selected the DRG system, a case-mix methodology developed at Yale University, primarily due to its promise to encourage improvements in hospital efficiency which would lead to lower costs and better care. Under the DRG system, hospitals are paid predetermined rates for care provided patients classified by diagnosis. Because hospitals are allowed to retain the difference between the predetermined rates and their actual costs in providing care, they have incentive to improve efficiency. Conversely, because hospitals must absorb within certain boundaries costs that exceed the predetermined rates, inefficiency is penalized.

The Yale researchers who devised the DRG system had sought initially to improve hospital cost accounting by applying the standard techniques of industrial management, especially product line accounting, to hospital settings.^{6,7} They believed that efficiency gains would result if hospitals could identify the costs required to produce particular hospital products or outputs. Their search for a hospital analogy to a manufacturer's product led them to classify admissions and costs by diagnosis. When hospitals appeared uninterested in the new accounting system—hospitals had no need to be concerned about cost control under the then prevailing retrospective cost reimbursement arrangements—the Yale researchers sought to link DRGs to reimbursement and compel an interest in efficiency.⁸

In the late 1970s when the DRG system was being formulated, the federal government was blocked by Congress from instituting a national scheme to control hospital costs. It then began to encourage the states

to experiment with their own cost control programs. New Jersey was an early volunteer and received federal grants to revise and implement the DRG system.

The team the state assembled to manage the DRG experiment recognized that hospital costs were largely determined by the clinical decisions of physicians.⁹ Hospital administrators would have to influence these resource use decisions if the system's cost control objectives were to be achieved. New Jersey's all-payer arrangement would help by providing hospitals with consistent rates for patients treated for the same diagnosis classification. The actual rates were to be based on the historic cost experience of statewide groupings of hospitals for each diagnosis. Periodic need to adjust the DRG rates to reflect recent experience and new technology would allow for the rates to be pushed down to the point at which physicians would be forced to accept direction about their resource use from administrators if hospitals were to remain solvent. Implementation of the system began in 1980. By 1983, all of the state's hospitals were being reimbursed by DRGs.

Our evaluation examined the overall economic impact of DRG regulation and the effect on hospital management. To determine the effect on hospital costs, we compared hospital experience in New Jersey before and after the introduction of DRGs. Length of hospital stays declined with the use of DRGs, but admissions increased somewhat. Measured on hospital expenditure per capita basis, the rate of hospital cost inflation was fairly constant under both SHARE and DRG regulation. New Jersey's rate of hospital inflation was below regional and national averages with DRGs, but so was it under the SHARE system. Overall, the economic impact of DRGs was quite negligible.¹⁰

To explore the effect on management, we conducted interviews at a stratified sample of hospitals in New Jersey. There was no discernible effect on clinical practices. Some hospitals had to curtail expenditures, but others found their margins improving. Those that had to trim expenditures reduced staffing or sought better supply prices. Several hospitals expanded services, particularly unregulated services, to increase revenues. There was much collection of DRG data, but little attempt to use this information to influence physician behavior. The reduction in length of stay was across the spectrum of care, affecting profitable DRGs as well as unprofitable ones. The clinical authority of physicians remained unimpaired.⁸

No doubt the failure of DRGs to alter the overall cost of care or the management structure of hospitals was due in large part to the fact that DRG rate regulations were no more constraining than were SHARE regulations. When the DRG regulations were being drafted, hospital administrators sought and obtained a number of important concessions. They were worried about the uncertain impact of an untried system on their facilities and preferred to make the system as familiar as possible. The approved rates were based more on individual hospital experience rather than class averages. The outlier trim points (which determine the range of costs that would be considered average) were set narrowly so that much of the care given was to be reimbursed outside the DRG system on the basis of the actual cost incurred. Outpatient care, capital ex-

penditures, and various overhead categories also were reimbursed outside the DRG system.

The state agreed to these and other concessions in order to gain hospital cooperation in the difficult transition to the new rate system. It was thought that the lure of profits permitted in the DRG system might be enough to produce the desired results and, if that was not sufficient, then the system could be tightened in the periodic rebasing of rates. Neither occurred.

Hospitals, it seems, are more complex organizations than the DRG designers envisioned.¹¹⁻¹³ Professional incentives are at least as important in determining hospital behavior as are economic incentives. With the law and the initial rates ensuring financial stability, additional profits had no lure. When hospital margins improved, surpluses were quickly absorbed in buying new equipment or hiring additional staff. Hospitals that were inattentive did risk losses. As was indicated, however, they used traditional revenue enhancing and cost-cutting methods to recover financial health. Hospital administrators had no desire to challenge the authority of physicians. On the contrary, they considered their role as insulating clinicians from the vagaries of rate regulations. Whether through lobbying or the management of hospital resources, the goal of administrators was to protect clinical decisions rather than to influence them. Their success in obtaining this goal was evident in the fact few physicians interviewed knew or cared much about the change in reimbursement methodology.

The question then becomes why was not the system tightened to achieve structural changes and cost reductions. The regulatory concessions were thought to be only temporary, yet they largely remain in place. The ratcheting down of the DRG prices, which on its own could have forced the desired results, did not happen.

THE PROBLEM OF INNOVATION IN GOVERNMENT

The federal grants permitted the Department of Health to hire a special staff to manage the DRG project.⁵ Such a staff was thought necessary because officials viewed the department's regular employees as being too unimaginative to cope with the complex tasks involved in implementing the innovative, but untried reimbursement system. With the attraction of a challenging project and higher than customary state salaries, a group of bright, young people was recruited.

Counting the department's senior managers who monitored the DRG project, 11 individuals can be identified as being central to the success of the effort. Only 1 individual is still with the department. Ten of the 11 persons left by 1982, before the DRG system was fully implemented and before the point at which any rate rebasing could occur to force improvements in hospital efficiency. One or two persons left because of a change in administrations brought about by the election of a Republican governor in 1981. Most left for better positions, including some that were out of state. Several established their own consulting firms, often acquiring clients from among the hospitals they had regulated.

The New Jersey DRG experiment attracted much attention within the health care industry from its very announcement. Everyone in the industry wanted to be better informed about the new approach to reimburse-

ment which was invariably described in the trade press as revolutionary. The project staff gained national visibility as experts in the DRG methodology. Invitations to lecture and write on DRGs were soon followed by job offers. When the actual implementation began, the pace of recruitment quickened. What was a threat to some, became an opportunity to others. If DRGs were to be the reimbursement standard of the future, then the industry needed its own experts or at least needed to own the experts.

Our evaluation examined the overall economic impact of DRG regulation and the effect on management.

Implementation in New Jersey lagged because the innovators were gone. One by one these innovators accepted the more challenging, better paying positions that they were offered—the career enhancing opportunities that could not be resisted. The innovators were better off, but the innovation was not. The regular staff, which was bypassed because it was not thought competent to initiate the DRG system, was left to oversee its implementation.¹⁴⁻¹⁵

In our society, the richest prizes go to those employed in the private sector, not the public sector.¹⁶ It is possible to assemble in state government a bright, vigorous team, but it is not possible to hold it together for very long. Intriguing proposals can be introduced. Persuasive plans can be announced and even initiated. But it is unlikely that there will be a staff in place that is capable enough or committed enough to see them through to fruition.

The federal government fares no differently. The first DRG-type reimbursement system, although it was not recognized as such in the Yale development, was in the federal Medicare program in 1972.¹⁷ In that year, Congress established the End Stage Renal Disease (ESRD) program as part of Medicare. In implementing the program, the federal government adopted a payment system to reimburse dialysis providers that foretold the DRG methodology. Fixed payments were made for each dialysis session to give incentive for efficiency. Over time the rates were to be ratcheted down to capture the gains and reduce government expenditures. But like DRGs, the promise of the payment system was better than the performance.

The cost of the program has soared since the early 1970s. What was once a \$200 million effort now is nearly \$2 billion. The program's cost growth is largely explained by increased patient enrollment as a prohibitively expensive treatment was made available to all who might benefit from it.¹⁸ But the costs increased also because the initial treatment prices, set high to encourage the provisions of services, were not adjusted for over a decade. Efficiency gains occurred, but federal taxpayers gained little from them.

Like that of the states, the federal government's administrative capacity is limited. The attention paid to the design of the ESRD program faded in its implementation as officials left or had their energies ab-

The federal government encouraged states to experiment with their own cost control programs. New Jersey was an early volunteer and received federal grants to implement the DRG system.

sorbed by other pressing problems. For years, it was unclear who within the supervising agency actually was in charge of the program. By the time the rates were addressed, millions of dollars in potential savings had been lost.¹⁹

The administrative weakness of government in American society does not explain fully the failure of reimbursement systems to constrain costs. Comparative analysis reveals that it is the conflict among governmental goals as much as the capacity to achieve any particular goal that limits the effectiveness of innovative reimbursement schemes.

A USEFUL COMPARISON

Cross national comparisons are common in health policy studies, foreign travel no doubt being the lure. The temptation is to compare Passaic with Paris and Camden with Copenhagen. But differences in political traditions, national culture, and structure of the health care systems—to cite only a few of the important variables—complicate the analysis. A more useful comparison is one between policy areas which would hold these contextual variables constant.

An appropriate comparison is with defense procurement.²⁰ Health and defense, in fact, share many characteristics. Both are technologically oriented policy areas; both are dominated by strong professions; both absorb enormous resources; and both are heavily dependent upon the private sector for the provision of government-financed services.

The reimbursement systems for defense contractors and hospitals are strikingly similar. Cost-based retrospective reimbursement, the system that prospective payment arrangements like DRGs replaced, is known in defense procurement as cost plus contracting and was used extensively during the 1940s and 1950s. Under its provisions, contractors were offered full cost reimbursement for the development of weapons plus a predetermined profit (the plus in cost plus contracting). Because weapons were under continual refinement, it became harder and harder to separate development from production efforts which were subject to the use of fixed price contracts. By the 1960s, the cost-generating problems of these contracting practices were obvious as was the failure of regulatory efforts to control the costs. Robert McNamara became Secretary of Defense in 1961 and instituted a series of procurement reforms, the most relevant feature of which was the requirement that incentive-type contracts be used where possible in place of cost reimbursement-type contracts.²¹ Incentive contracts resemble the outline of the DRG reform in that they offer contractors the opportunity to profit from cost savings, but also the risk of absorbing losses when costs exceed predetermined prices.

The results of the shift to incentive contracts were mixed. There were some cost savings, but not as much as advocates predicted.²² Incentive contracts and fixed

price arrangements, which also came into vogue again, had their own problems. Contractors cannot absorb very large losses nor can the government allow important contractors to make huge profits or to go out of business. When Lockheed was failing in part due to losses on its C-5A contract, the government provided the firm with a special loan. When General Dynamics threatened to default on its submarine construction contracts, the government made significant contract concessions. But let contractors make a lot of money, as occurred recently with spare parts purchasers, and a scandal results. Hearings are held and new laws are passed restricting potential profits. In the end though, the same contractors are busy making the same weapons. The military needs the weapons the contractors produce. Despite inefficiencies and scandals, the firms have to survive if national security is to be maintained. What cannot be tolerated are windfall profits or devastating losses no matter how persuasive the contracting logic.

Basically, the government was forced to realize that there are multiple, conflicting goals involved in defense contracting. Not only is there a desire for efficiency—cost control—but also a desire for high performance weapons produced as quickly as possible. In weapon acquisition jargon, there is a tradeoff among time, cost, and performance objectives. Accelerated delivery schedules and increased capabilities translate into increased costs. And, if cost dominates, then schedules and performances are likely to slip.

The parallel goals in health are cost control, quality, and access and there is a parallel lesson to be learned. Schemes like DRGs disappoint not only because we make government unattractive relative to private employment, but also because we want to preserve or increase access and quality. If the objective is simply to reduce costs, then the effect on access and quality could be ignored. Nearly always, however, there is pressure to improve both while reducing costs. If waste in the delivery of health care services was obvious then it might be possible to do this. But rarely will cost savings be achieved without at least a threat to access and quality. Conflicting goals limit the ability to reduce health care costs.

Finally, we need to recognize that politics pervades governmental activities. If Lockheed failed, thousands of workers in California, Georgia, and elsewhere in the nation would lose their jobs. If General Dynamics' Electric Boat division were to be put out of business, the economy of southeast Connecticut and southern Rhode Island would be severely disrupted. Similarly, in designing reimbursement programs, legislators and officials cannot ignore the effect on hospitals and health care professionals. No program can be pursued that will put all of the Catholic hospitals out of business or that would mean unemployment for half of the state's corps of nurses. There are political realities that temper the urge to reduce costs.

THE TECHNICAL LIMITATIONS

Lest some lament the constraints of politics, the technical limits of DRGs ought to be acknowledged. Tighter DRG prices could save money though perhaps at the cost of access for the needy and improvements in the quality of care. DRGs, however, are not a very effective device for managing hospital services.³

A major problem with the DRG system is that it does not adequately account for the full range of illness encountered. Included in the same DRGs are patients who differ significantly in the severity of their condition and in the cost of their treatment. DRG advocates claim that these severity differences average out and do not affect total reimbursement. They do not, however, average out within a hospital when individual physician profiles are being created. A few atypical cases can easily distort a physician's average for the entire year.

A major problem with the DRG system is that it does not adequately account for the full range of illness encountered; patients differ in severity of their condition and in treatment cost.

When the experience of high resource-using physicians is examined, another system problem is likely to be revealed. Unless an unusual amount is invested in computerized accounting procedures, it becomes quite difficult to sort out which physician actually is responsible for the costs. Difficult, expensive cases often require the collaboration of several physicians, surgeons as well as internists, even though the case may be listed only under the admitting physician or the senior surgeon. Residents may be ordering tests or drugs. Prolonged use of expensive, life-sustaining equipment may be needed. Consultants may be required. When something unusual happens in a hospital, responsibilities are likely to be shared.

To be sure, administrators still may want to collect expense data by physician, admitting or otherwise. The language of business has been absorbed into the hospital culture, producing an insatiable appetite for reports and frequent reference to terms such as strategic planning and product lines. But certain opposition from physicians makes it unlikely that the reports and rhetoric will lead to behavior change. So too do ethical considerations. Community obligations prevent the abandonment of many services. And few within the health care industry leap to be identified with decisions to refuse care because of costs or to manipulate treatment categories in order to gain higher reimbursements. DRG data may be wonderful to contemplate, but they are not guides to action.

CONCLUSIONS

New Jersey did accomplish much in its 1978 reform of hospital payment. It was one of the first states to ensure that hospital care would be available to all resi-

dents, and that hospitals that provided this care would not be bankrupted in the process. Those who finance care in the state have accepted a payment system that shares the burdens of paying for the uncompensated care equitably. Cost increases for hospital services have been limited to rates of growth that are less than national and regional experience and that are no worse than what was achieved under less inclusive reimbursement arrangements.

Despite its innovative design and its early promise the DRG component added little to the reform's overall accomplishments. The team assembled to guide the implementation of the DRG system found more challenging and lucrative opportunities before their task was completed. But even if they had remained in government, the team would not have been able to fulfill the expectations held for this new approach to hospital reimbursement. There are limitations inherent in any approach to reimbursement because of government's multiple and conflicting goals.

The producers of vital public services be they arsenals, weapon contractors, hospitals, or physicians, hold important policy leverage. In health care, cost containment efforts must be tempered by quality and access goals. The New Jersey reform recognized this requirement, the false promise of DRGs notwithstanding.

Although we continually search for panaceas, there are none. The federal government learned in defense that there is no simple or permanent solution to the problem of conflicting goals. So too will it learn in health care. The DRG payment system promises what cannot be achieved.

SUMMARY

New Jersey reformed its hospital reimbursement system in 1978, becoming the first state in the nation to use the Diagnosis Related Group (DRG) methodology for calculating payment rates.

The reform had significant benefits. Under its all-payer arrangements, access to hospital care for the state's residents and the financial viability of the state's hospitals serving the poor and uninsured was assured. Those who financed hospital care in New Jersey, and thus who provided the assured access and hospital income, had these burdens distributed in an equitable manner not possible in the preexisting reimbursement system. Health care costs continued on a trend that remained below national and regional experience.

The DRG component of the reform, however, did not fully achieve its objectives, especially as they related to the restructuring of managerial authority within hospitals. This was due, in part, to technical limits in the DRG methodology and to the early dispersion of the implementing team, most of whose members left for better paying and more challenging opportunities.

But the real obstacle to payment reform is the multiple and conflicting goals of health policy. Comparisons with defense procurement and the End Stage Renal Disease program demonstrate these limitations. Because government is concerned with access to services and the quality of care delivered, its cost control and system restructuring objectives will be constrained.

SINGLE HIGH DOSE-LARGE FIELD IRRADIATION

ANDREW ZABLOW, M.D., R.J. STABILE, M.D., L.J. SANFILIPPO (M.D., LIVINGSTON*)

Between 1980 and 1985, 19 patients with symptomatic metastatic carcinoma were treated with single high dose-large field irradiation. Treatments were well tolerated and good pain relief was induced in 83 percent of patients with minimal acceptable side effects.

Symptomatic bone metastases are common problems facing the radiation oncologist. Radiotherapy is an effective treatment modality for local control, preventing further destruction, and, in many cases, promoting osteogenesis. Various studies have shown that radiotherapy achieves partial to complete response rates of 73 to 96 percent in patients treated for pain palliation.^{1,2} Palliation of pain and maintenance of structural support is the key to successful management in maintaining a good quality of life. Symptomatic patients require prompt attention and aggressive management to insure this quality of life.

Radiation therapy commonly is employed to palliate the symptoms of diffuse metastatic carcinoma. It effectively can relieve pain, alleviate obstruction, control hemorrhage, and improve function. Patients presenting with these symptoms require the immediate attention of the oncologist. Affording palliative relief is the oncologist's therapeutic challenge. Now that many lives are being extended by improved treatment modalities, pain is a very common complaint for the cancer patient.

Approximately 50 percent of all radiation treatments are given to palliate the symptoms of metastatic disease;³ these result from metastatic breast, prostate, or lung carcinoma.

For diffusely metastatic disease, single high dose-

large field irradiation (SHD-LFI) has been used extensively and effectively to combat the distressing symptoms of cancer-related pain. Some of the early work in hemibody irradiation was done over a half century ago.⁴ The proved effectiveness of palliative hemibody irradiation is well documented.^{4,6}

HISTORY

Due to their known radiosensitivity, hematologic malignancies were primarily treated during the 1960s. Cunningham began work with systemic radiotherapy.⁷ In the early 1970s, results were published on the use of whole and partial body radiotherapy for the control of advanced solid tumors.⁸ In the later 1970s, Fitzpatrick and Rider treated patients with sequential hemibody irradiation with doses ranging from 500-1,000 rads directed at one-half of the body;⁵ they based some of their early theories on the work of Court-Brown and Abbatt who charted the hematologic response of the body to total body irradiation.⁹ The radiation effect was most pronounced upon the white blood cells and platelets. By 28 days after radiation therapy, thrombocytopenia, lymphopenia, and granulocytopenia were the rule. Recovery was prompt and

*From the Department of Radiation Oncology, Saint Barnabas Medical Center, Livingston. Correspondence may be addressed to Dr. Zablow, Saint Barnabas Medical Center, Livingston, NJ 07039.

Figure 1—Limits of upper hemibody and lower hemibody fields.

practically complete by day 30 after radiotherapy. Normal pretreatment levels were seen by the following week.

Fitzpatrick found that by separating the upper hemibody and lower hemibody treatments by a latent period of at least 28 days, total body irradiation could be hematologically tolerated. Hemoglobin and platelet counts remained relatively constant while small fluctuations were seen in the total white cell count. They found the main limitation to upper hemibody radiation to be lung tolerance.⁴ This problem subsequently was examined by Salazar.¹⁰ This study found that single doses of 800 rads (uncorrected for lung transmission) caused a 10 to 20 percent incidence of fatal radiation pneumonitis. Correcting for lung transmission, doses of 600 rads are safely tolerated with minimal pulmonary toxicity.¹⁰

Protocols also were established for premedication programs to minimize "acute radiation syndrome" seen with upper hemibody irradiation.

SINGLE HIGH DOSE-LARGE FIELD IRRADIATION EXPERIENCE

From 1980 to 1985, we used single high dose-large field irradiation (SHD-LFI) to induce palliation in 19 patients with symptomatic metastatic carcinoma; these were advanced cases that had failed other conventional therapies. The patient population included 8 males and 11 females; the age range for males was 57 to 79 years and 40 to 68 years for females. The primary sites of disease included eight breast cases,

Figure 2—Limits of middle hemibody field.

seven prostate, and one each of lung, multiple myeloma, ovary, and epidermoid carcinoma of the skin. The upper hemibody (UHB) was irradiated in 8 patients the lower hemibody (LHB) was irradiated in 14 patients. This included 5 patients who also received UHE irradiation. Two patients received middle hemibody (MHB) irradiation which encompassed the abdomen and pelvis (Table 1).

Single doses of 600 to 1,000 rads were delivered at low dose rates of 25 to 40 rads per minute. The dose was delivered evenly through both anterior-posterior and posterior-anterior fields using an extended SSD of approximately 200 cm. All the patients were treated on a Clinac 18 utilizing 10 MeV photons. The limits of the fields are shown in Figures 1 and 2.

When treating the UHB, certain procedures were followed: 24-hour hospitalization for the actual procedure followed by a weekly check-up and complete blood count for the first two months and monthly follow-up thereafter; blocking the parotid glands, eyes, and previously treated fields; corrections for lung transmission; calculating a treatment gap as needed; and premedication program (Table 2).

Side effects of the treatments included nausea, fatigue, and diarrhea; others are shown in Table 3.

RESULTS

In our experience, we were able to produce good palliative pain relief in 83 percent of the patients treated. This usually was dramatically seen within the first 24 to 48 hours post-treatment. In two patients,

we saw progressive reduction in the size of tumor masses and visceral enlargement.

The hemibody radiotherapy is well tolerated by the patients and, in most cases, provides effective prolonged symptomatic relief. The side effects are transient in nature, respond to conservative management, and appear to be tolerable. The hematological toxicity is minimal and safe. The CBC and platelet counts return to pretreatment levels within six to eight weeks after the procedure.

B. Torecan 2 cc intramuscularly on call to radiotherapy, then every 4 hours as needed post-radiotherapy.	
C. 1,000 cc etc. prior to radiotherapy.	
D. Nothing by mouth 6 hours pre-radiotherapy.	
E. RT = radiotherapy; IV = intravenously.	
F. Vital signs every hour for 12 hours post-radiotherapy, then every four hours.	

SHD-LFI appears to be a highly effective treatment for advanced metastatic disease that has failed conventional modalities. We found good symptomatic relief in 20 out of 24 patients treated. This included 2 patients who had relief secondary to dramatic shrinkage of tumor mass involving viscera (Table 4).

If we separate the patients by site of disease, we found that 90 percent of the breast and prostate patients had good relief. In the other diseases treated, we saw 50 percent of patients had good relief. Table 5 shows the response to treatment by tumor site.

With SHD-LFI, treatment of several involved areas with metastatic disease can be encompassed into one treatment session, whereas conventional therapy requires several treatment sites and multiple treatment fractions. The ease of delivering the treatment and its effectiveness is well recognized by those utilizing it and those being treated. This is in contrast to the more protracted treatments which usually provide good palliation but are very tedious to the patient.

The average length of life after treatment was 4.5 months with a range of one-half to ten months. Two patients still are alive with disease. The great majority of patients who showed good symptomatic relief following treatment had continued relief for the remainder of their lives. Two patients continued to experience pain within the treatment field; additional radiother-

apy was given to the small symptomatic areas and afforded good pain control.

CONCLUSIONS

SHD-LFI is an effective short-term treatment for multiple sites of disease. SHD-LFI achieves good, enduring pain palliation that usually is dramatically seen within 24 to 48 hours. SHD-LFI can cause regression in the size of tumor masses, visceral and nodal enlargement, and concomitantly offers relief from the symptoms associated with these masses. SHD-LFI is well tolerated with minimal toxicity experienced by the patients. Modified SHD-LFI can be utilized in patients previously treated with local radiotherapy and/or chemotherapy.

LEFT LATERAL INTERNAL SPHINCTEROTOMY FOR ANAL FISSURE—AS AN OFFICE PROCEDURE

LEWIS D. ZINKIN, (M.D., EAST BRUNSWICK*)

Patients with anal fissures seek prompt diagnosis and treatment for a painful condition. Although the left lateral internal sphincterotomy has been accepted, it usually has been done for chronic fissures and in the hospital surgical suite. The author advocates a simplified method of internal sphincterotomy as an office procedure.

Anal fissure is a common anorectal disorder seen by primary care physicians, gastroenterologists, and general and colo-rectal surgeons. It causes considerable pain and disability for the patient and should be diagnosed easily and accurately. Prompt treatment will minimize suffering.

Although the technique of lateral internal sphincterotomy generally has been accepted as the preferable treatment for chronic anal fissure,^{1,2} it often is considered a hospital procedure and then only for the chronic phase of the condition. The inherent disadvantages of this approach, in terms of cost and time, should be considered. This paper demonstrates the technique of lateral internal sphincterotomy as an office procedure and advocates its more liberal use.

TECHNIQUE

The patient is placed in the prone jack-knife position or the left lateral Sims position. The buttocks can be taped apart to facilitate exposure. A local anesthetic, such as lidocaine 2 percent or bupivacaine 0.5 percent with 1:200,000 epinephrine, is used to infiltrate the left lateral perianal area with some infiltration extending to the anterior and posterior midline (Figure 1). The injection is the only painful part of the procedure and the patient, when forewarned, generally can tolerate it quite well.

A small incision (radial or concentric) is made over the intersphincteric groove. The anodermal tissue is elevated off the internal sphincter up to the dentate margin by scissor dissection (Figure 2). No anal retractor is necessary. The intersphincteric plane is likewise developed. The "isolated" internal sphincter, with its easily identifiable whitish muscle fibers, is grasped with a straight hemostat and sharply cut (Figure 3). Hemostasis is achieved by electrocoagulation and/or direct pressure. No sutures are used. The small incision is left open. A simple dressing then is applied. The procedure takes five to ten minutes to perform.

Wound care consists of warm sitz baths, moist baby-wipe tissues for anal hygiene, an antibiotic ointment to the wound, and a simple dressing gauze cover. The wound closes rapidly within a few days. One post-operative visit after two weeks usually is all that is necessary.

RESULTS

Charts of 163 patients seen from January 1980 to January 1986, who were diagnosed as having an anal

*Dr. Zinkin is affiliated with the Department of Surgery, Attending in Colo-Rectal Surgery, UMDNJ-Robert Wood Johnson University Hospital and St. Peter's Medical Center, both in New Brunswick. Correspondence may be addressed to Dr. Zinkin, Brier Hill Court B-3, East Brunswick, NJ 08816.

Figure 1—Local anesthesia is injected into the left perianal tissue with some extension to the anterior and posterior midlines.

fissure, were reviewed. Of these, 76 patients were considered as having an acute fissure, i.e. their symptoms were occurring for the first time and were less than three weeks in duration, and 87 patients had a chronic fissure; the latter group had recurrent symptoms or symptoms occurring for the first time, but present for greater than three weeks.

Of the 163 patients with an anal fissure, 29 patients were treated initially by conservative therapy, i.e. stool softeners, topical anesthetics, sitz baths. Of the 29 patients treated conservatively, 17 patients came to surgery for recurrent symptoms. The remaining 134 patients were treated by a left lateral internal sphincterotomy as the initial treatment. Only 4 of these procedures had to be performed in the hospital either for specific medical needs, e.g. antibiotic prophylaxis for a patient with mitral valve prolapse, or a strong patient preference or anxiety.

Of the 151 patients who underwent left lateral internal sphincterotomy, 94.7 percent showed prompt healing of the fissure and immediate relief of pain due to spasm. Analgesics were rarely needed by the second day after the procedure. The only complication was infection at the sphincterotomy site in 5.3 percent of the patients. Infection presented as a perianal abscess or, more commonly, as purulent drainage through the wound. Even in those patients with wound infection, the pain of the fissure had resolved. Patients in this group who developed infection were treated by simple re-opening of the wound (2 patients) or fistulotomy (6 patients).

DISCUSSION

Anal fissures affect a large number of people. Physicians who see patients in any outpatient facility should be aware of the typical symptoms and findings associated with a fissure. A fissure has a typical pattern of pain which is initiated by a bowel evacuation and lingers up to several hours. Studies have shown that the pain of a fissure is caused by spasm of the internal sphincter.^{3,4} Whether this hypertonicity of the

Figure 2—A small 5 mm incision is made and the anoderm is dissected off the internal sphincter up to the dentate margin. The intersphincteric space behind the sphincter is likewise freed.

Figure 3—The internal sphincter is grasped and sharply cut.

sphincter is cause or effect is uncertain, however, until the spasm is relieved, the fissure will continue.

This concept of the internal sphincter being the underlying perpetuating factor is what accounts for the success of the sphincterotomy. Initially, the procedure was done in the posterior midline, right through the exposed bed of the fissure. However, this approach has been largely abandoned because of the problems with poor healing.⁵ In its place, the lateral sphincterotomy has become increasingly popular.

When a patient appears with the typical symptoms of severe, intermittent anal pain and the findings of an anal fissure (usually present in the posterior midline and sometimes in the anterior midline), a decision needs to be made as to therapy. Conservative therapy usually consists of stool softeners, warm sitz baths, and a topical anesthetic/steroid cream. Shub and colleagues reported a cure rate of 44 percent with conservative therapy within a four-to-eight-week period.⁶ Although a similar cure rate for acute fissures was seen in this series (12 of the 29 patients treated), the fact that failure of therapy was more likely and that, even when successful, the length of time suffering was longer, made this approach less appealing. Furthermore, the chance for cure of a chronic fissure by conservative therapy is even less.

I have taken a more aggressive approach in the treatment of fissures and have treated most patients with a left lateral internal sphincterotomy as an initial therapy. The main advantages of this approach are the almost immediate relief of pain and the prompt healing of the fissure. One of the disadvantages has been that most physicians have felt it necessary to perform

this procedure within the hospital. This entails the delays inherent in hospital scheduling. The patient must continue to be in pain while a mutually convenient time is set for surgery. Furthermore, even if the procedure is done on an ambulatory basis or in a one-day surgery unit, the hospital costs are considerable, ranging from \$500 to \$1500. If an anesthesiologist is present, common for in-hospital procedures, an additional fee must be considered. In this era of fiscal responsibility in health care, these factors and costs should be of concern for the medical practitioner.

SUMMARY

Anal fissure is a common anorectal problem. Patients are in considerable pain and seek prompt relief. The left lateral internal sphincterotomy has been shown to be an effective method of achieving prompt relief of pain and rapid healing of the fissure. The

technique, as described, is done easily and in the office, thus eliminating the unnecessary delay and costs associated with in-hospital surgery.

CASE REPORT: DISSECTING ASCENDING AORTIC ANEURYSM IN PUERPERIUM

AMRIT P. NAYAR, M.D., AND DUANE G. SOSSONG, D.O., CHERRY HILL*

We illustrate the necessity of considering aortic dissection in the differential diagnosis of chest pain in the postpartum patient. Symptoms of chest pain should be a signal for prompt evaluation. Aggressive diagnostic and therapeutic approach should be taken to alter the outcome of this potentially fatal problem.

Dissecting aortic aneurysms are known to be associated with pregnancy. The incidence of dissecting aortic aneurysms in the postpartum period has not been as well discussed in the literature. The following is a case report of a patient who developed dissecting ascending aortic aneurysm 16 days after parturition. The patient underwent successful surgical repair and is doing well 15 months postoperatively.

CASE REPORT

A 22-year-old black female, gravida 3, para 2, had a normal vaginal delivery on September 25, 1985. She appeared in the emergency room on October 11, 1985, with a chief complaint of retrosternal pain, described as moderate pressure sensation which began two hours prior to admission. There was no radiation of pain, nausea, vomiting, or diaphoresis. She had a short episode of chest pain which was felt to be musculoskeletal in origin in the first postpartum day. An electrocardiogram at that time was normal. Her past medical history was significant for a heart murmur of undetermined etiology since age 14, and she was not taking any medications prior to the admission; family history was unremarkable.

The physical examination revealed blood pressure 150/70 and pulse 96/minute. The cardiac examination was significant for a grade III/VI systolic ejection

murmur heard best over the right sternal border and a grade III/VI decrescendo diastolic murmur heard best over the left sternal border. The lungs were clear on auscultation. The peripheral pulses were intact and blood pressures were obtained.

The laboratory results were as follows: white blood cell count of 11.3; hemoglobin of 13.3 gm/dl; hematocrit 39.2 percent; serum sodium 140 mg/dl; serum chloride 107 mg/dl; bicarbonate 27 meq/l; blood sugar 103 mg/dl; BUN 12 mg/dl; serum creatinine 0.9 mg/dl; amylase 57 units; and CPK 135 units. Electrocardiogram was normal with sinus tachycardia. Radiologic evaluation of the chest demonstrated widened mediastinum (Figure 1). A diagnosis of ascending aortic dissection was entertained and confirmed with cardiac catheterization and aortogram (Figure 2).

The patient was taken to the operating room for an emergency sternotomy. Findings included 150 cc sanguinous pericardial effusion. There was a moderately large aneurysm of the ascending aorta measuring 7 cm in transverse diameter, with ecchymosis. There was an oblique tear extending along the posterior two-thirds of the circumference of the ascending aorta just above

*From the Department of Cardiac Surgery, Our Lady of Lourdes Medical Center, Camden. Correspondence may be addressed to Dr. Nayar, 1245 Brace Road, Cherry Hill, NJ 08034.

Figure 1—Chest x-ray of our patient showing widening of the mediastinum.

the left main coronary ostium. The aortic valve was bileaflet. Patient underwent excision and replacement of aortic valve and ascending aorta with #25 Bjork Shiley composite graft valve conduit and coronary implantation.

The hospital postoperative course was satisfactory and uneventful; the patient was discharged on postoperative day 12. Pathology report revealed unremarkable aortic valve and no pathologic evidence in the aortic wall.

DISCUSSION

About 50 percent of aortic dissections in women younger than 40 years of age are associated with pregnancy.^{1,3} By far, most dissections in pregnancy occur during the third trimester⁴ and are relatively rare during labor. When reviewing the literature of dissecting aortic aneurysms during the postpartum period, only 15 cases could be identified.^{2,4,5} Previous reports of dissecting aortic aneurysms successfully treated during pregnancy using surgical techniques have been reported in the literature.⁷⁻⁹ Unfortunately, in the vast majority of cases, the diagnosis is made late in the clinical course; this accounts for the high mortality. Prior to the 1950s, most cases were diagnosed at autopsy. Death occurred in 78 percent due to secondary rupture into the pericardium.⁶

Figure 2—Cineangiogram showing dissecting ascending aortic aneurysm with intimal flap and aortic regurgitation.

Our patient was mildly hypertensive; hypertension was present only in approximately half of reported cases.² Pedowitz et al. stated that hypertension is not a predisposing factor.⁴ Our patient did not have any evidence of coarctation of the aorta or any connective tissue disorder, though bicuspid aortic valve was present. This may be seen in one-third of the cases.⁵ The presenting symptoms were consistent with angina and not the typical ‘tearing’ pains associated with a dissecting aneurysm.

**The benefit of antianginal
protection plus safety...**

CARDIZEM: **A FULLER LIFE**

diltiazem HCl/Marion

60 mg **GREATER**
90 mg **DOSAGE**
120 mg **FLEXIBILITY**

A remarkable safety profile¹⁻⁶

The low incidence of side effects with Cardizem allows patients to feel better.

Protection against angina attacks^{1,5,7-9}

The predictable efficacy of Cardizem in stable exertional* and vasospastic angina allows patients to do more.

A decrease in myocardial oxygen demand

Resulting from a lowered heart rate-blood pressure product.⁵

Compatible with other antianginals⁶⁺

Safe in angina with coexisting hypertension, COPD, asthma, or PVD^{1,3,5,6}

*CARDIZEM® (diltiazem HCl) is indicated in the treatment of angina pectoris due to coronary artery spasm and in the management of chronic stable angina (classic effort-associated angina) in patients who cannot tolerate therapy with beta-blockers and/or nitroles or who remain symptomatic despite adequate doses of these agents.

†See Warnings and Precautions.

Please see brief summary of prescribing information on the next page.

0453S7

CARDIZEM[®] ANTIANGINAL PROTECTION

diltiazem HCl/Marion PLUS SAFETY

Usual maintenance dosage range: 180-360 mg/day

Brief Summary

Professional Use Information

CARDIZEM[®]
(diltiazem HCl) 30 mg, 60 mg, 90 mg, and 120 mg Tablets

CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, and (3) patients with hypotension (less than 90 mm Hg systolic).

WARNINGS

- Cardiac Conduction.** CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (six of 1,243 patients for 0.48%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.
- Congestive Heart Failure.** Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt). Experience with the use of CARDIZEM alone or in combination with beta-blockers in patients with impaired ventricular function is very limited. Caution should be exercised when using the drug in such patients.
- Hypotension.** Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.
- Acute Hepatic Injury.** In rare instances, significant elevations in enzymes such as alkaline phosphatase, CPK, LDH, SGOT, SGPT, and other symptoms consistent with acute hepatic injury have been noted. These reactions have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in most cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any new drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies,

oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes; however, these changes were reversible with continued dosing.

Drug Interaction. Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated. Available data are not sufficient, however, to predict the effects of concomitant treatment, particularly in patients with left ventricular dysfunction or cardiac conduction abnormalities. In healthy volunteers, diltiazem has been shown to increase serum digoxin levels up to 20%.

Coronogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in *in vitro* bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women; therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded.

In domestic placebo-controlled trials, the incidence of adverse reactions reported during CARDIZEM therapy was not greater than that reported during placebo therapy.

The following represent occurrences observed in clinical studies which can be of least reasonably associated with the pharmacology of calcium influx inhibition. In many cases, the relationship to CARDIZEM has not been established. The most common occurrences as well as their frequency of presentation are: edema (2.4%), headache (2.1%), nausea (1.9%), dizziness (1.5%), rash (1.3%), asthenia (1.2%). In addition, the following events were reported infrequently (less than 1%):

Rx

Cardizem[®]
(diltiazem HCl)

☐ 60 mg ☐ 90 mg
☐ 120 mg

Sig: tid

- | | |
|-------------------|---|
| Cardiovascular: | Angina, arrhythmia, AV block (first degree), AV block (second or third degree — see conduction warning), bradycardia, congestive heart failure, flushing, hypotension, palpitations, syncope. |
| Nervous System: | Amnesia, gait abnormality, hallucinations, insomnia, nervousness, paresthesia, personality change, somnolence, tinnitus, tremor. |
| Gastrointestinal: | Anorexia, constipation, diarrhea, dysgeusia, dyspepsia, mild elevations of alkaline phosphatase, SGOT, SGPT, and LDH (see hepatic warnings), vomiting, weight increase. |
| Dermatologic: | Petechiae, pruritus, photosensitivity, urticaria. |
| Other: | Amblyopia, dyspnea, epistaxis, eye irritation, hyperglycemia, nasal congestion, nocturia, osteoarthralgia pain, polyuria, sexual difficulties. |

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme, and leukopenia. However, a definitive cause and effect between these events and CARDIZEM therapy is yet to be established.

DOCTORS' NOTEBOOK

**Trustees' Minutes; UMDNJ
Notes; MSNJ Auxiliary;
New Members; Physicians
Seeking Location in
New Jersey**

Trustees' Minutes November 15, 1987

A regular meeting of the Board of Trustees was held on November 15, 1987, at the Executive Offices in Lawrenceville. A detailed report is on file with the secretary of your county society. A summary of significant actions follows:

Report of the President . . .

(1) **Task Force on AIDS** . . . Noted that Leon G. Smith, M.D., will serve as the chairman of the newly formed Task Force on AIDS.

(2) **Insurance Carrier Performance of Utilization Review** . . . Noted that performance of utilization review in hospitals by insurance carriers was one of the issues discussed at the meeting with Commissioner of Health Coye and Commissioner of Insurance Merin.

Report of Executive Director . . .

(1) **MSNJ Paid Membership** . . . Was advised that there has been no significant change in the number of paid memberships over the past four years; noted that a report on dues-exempt members will be com-

pleted by the Committee on Long-Range Planning and Development.

(2) **MSNJ Financial Statements** . . . Approved the financial statements for the periods ending August 31, 1987, and September 30, 1987.

(3) **State Commission of Investigation on Medical Discipline and Licensing in New Jersey** . . . Approved the following recommendation:

That the Executive Committee be authorized to monitor closely the Impaired Physicians Program on an ongoing basis; to respond to the press and legislature as the need arises; and to retain special legal counsel.

Also, referred the following two recommendations to the Executive Committee:

(1) That the name of the Impaired Physicians Program be changed to the "Physicians Assistance Program."

(2) That the Board authorize the employment of an additional physician, counselor, and secretary for the Impaired Physicians Program.

(4) **New Jersey State Medical Underwriters, Inc.** . . .

(a) **1988 Rates and Classification (MIENJ)** . . . Was advised that the New Jersey State Medical Underwriters insurance rates for 1988 will be the same as for the current year and the 1978 dividend will be increased from 10 to 11 percent.

(5) **Litigation** . . .

(a) **Wilk Case** . . . Heard that the Federal Court has determined the AMA did discriminate against chiropractors; hence, the AMA might be required to publish the District Court injunctive order in one issue of JAMA.

(b) **Insurance Department Plan for Medical Malpractice** . . . Received as information the MSNJ comments regarding the Insurance Department Medical Insurance Performance Program sent to Commissioner Merin.

(c) **Third-Party Interference** . . . Noted that a meeting with the Insurance Commissioner has been scheduled to discuss complaints by attending physicians regarding pre-admission authorizations required by third-party carriers.

(d) **Hospital Licensing Standard Reform Project** . . . Noted that MSNJ is cooperating with the New Jersey Department of Health by mailing survey questionnaires to selected physicians with a request

for their expert opinions concerning a reform of hospital licensing standards.

UMDNJ Report . . .

(1) **AIDS-Related Research** . . . Heard that UMDNJ received three multimillion dollar grants from the National Institutes of Health for AIDS-related research.

(2) **Site Visit by Liaison Committee on Medical Education** . . . Note that the Robert Wood Johnson Medical School received high marks from the Liaison Committee on Medical Education.

(3) **AMA Visits Medical School** . . . Noted the AMA will have one-day visits to both medical schools in spring 1988, and may include representatives of MSNJ.

(4) **Test of Clinical Skills To Be a Certification Requirement** . . . Noted that UMDNJ's Board of Trustees voted to include a test of clinical skills as part of the medical school examination process beginning in 1989.

(5) **Doctor Formica To Serve on Search Committee** . . . Heard that Doctor Formica will represent MSNJ on the search committee being assembled to select a new dean for the Robert Wood Johnson Medical School.

NJ Hospital Association . . .

(1) **DRGs** . . . Noted that M. Scibetta defined DRGs, from the hospitals' perspective, as a mechanism for allocating costs, and indicated the hospital system is being jeopardized by lack of money; the NJHA focus is on monetary rather than regulatory concerns.

(2) **Nursing Shortage** . . . Note that the Hospital Rate-Setting Commission acceded to NJHA's request for an immediate 2 percent adjustment to the labor component of the economic factor, a temporary measure to run through December 31, 1987; the purpose was to eliminate deficits resulting from past salary increases for nurses.

Council on Medical Services . . .

(1) **Medallion Plan** . . . Approved unanimously the following recommendation:

(1) That the Society reject the proposal to advise the Society's membership that it is in their best interest to consider rejecting "participating" status in Blue Shield; and in its place, a balanced pro-

sentation in a general fact sheet format be released to assist the membership in rendering their own individual decisions regarding participation.

Also, the following recommendation was unanimously approved as amended:

(2) That the Board be advised that the Council is opposed to the concept of differential/discriminatory reimbursements for identical services rendered whether a physician is participating or not, and saw no legal remedy possible.

Also, the following recommendation was approved:

(3) That the Board seek an independent legal opinion to determine whether the Blue Shield position that Pace-participants also are participants in the Medicaid is valid.

Finally, the following recommendation was unanimously approved:

(4) That the Board should further explore the January 1980 directive by past Insurance Commissioner Sheeran, directing Blue Shield to include its membership of participating physicians in all their programs, and that if it is found that the directive requires Blue Shield to do this, legislative or administrative relief should be sought.

(2) Resolution #30E: Uniform National Standards of Care . . . Unanimously approved as amended the following recommendation:

That because of the the thousands of variables, uniform standards of care cannot be formulated at this time by our Society.

Council on Public Relations . . .

(1) Resolution #14: Free Choice of Physicians . . . Noted that a new advertisement, "Health Care Options: They're Enough To Make You Dizzy," was published in daily newspapers on August 27, 1987.

(2) Resolution #20: MSNJ Public Relations Activities . . . Noted that the Council is planning implementation of this Resolution calling for an all-out public relations effort.

(3) Substitute Resolution #24: Public Relations Sponsorship with Connecticut, Delaware, New York, and Pennsylvania . . . Noted that the other four state societies had an unfavorable response to this Resolution and no further action is contemplated.

(4) Special Assessment . . . Noted that a second mailing has been sent to members concerning the special assessment mandated by the House of Delegates to fund activities of the Council on Public Relations.

Committee on Publication . . .

(1) Disclaimer for Advertisements . . . Approved with editorial corrections the following recommendation:

That the following advertising disclaimer appear on the masthead of *NEW JERSEY MEDICINE*: "The appearance of advertising in *NEW JERSEY MEDICINE* is not a Medical Society of New Jersey guarantee or endorsement of the product or service, or the claims made for the product or service, by the advertiser. When the Medical Society of New Jersey has endorsed a product or program, that will be expressly noted."

(2) Committee Minutes . . . Requested copies of the minutes of meetings of the Committee on Publication and requested the chairman of the Committee to attend Board meetings when there is a report from his Committee.

(3) Graphics/Photographs in NEW JERSEY MEDICINE . . . Advised by Mr. Maressa that he has delayed consideration of the issue of graphics in the computer operations of MSNJ.

(4) Membership Newsletter . . . Approved a motion which directs the Board to advise the Committee on Publication that the Membership Newsletter is the responsibility of the executive staff of the Medical Society of New Jersey.

Committee on Senior Citizens . . . Approved the following recommendation:

That the Board of Trustees request each county medical society to appoint a representative to the Committee on Senior Citizens.

MEDICAL SOCIETY OF NEW JERSEY ANNUAL MEETING

April 27-May 1, 1988
Sheraton Meadowlands Hotel
East Rutherford

Proposed Daily Schedule

Wednesday, April 27, 1988

3:30 p.m.—Board of Trustees' Meeting

Thursday, April 28, 1988

9:00 a.m.—Registration Opens

9:00 a.m.—Message Center Opens

2:00 p.m.—House of Delegates

3:30 p.m.—Reference Committees

Friday, April 29, 1988

8:00 a.m.—Registration Opens

8:00 a.m.—Message Center Opens

8:30 a.m.—Exhibits Open

9:00 a.m.—House of Delegates (election)

12:00 noon—Golden Merit Award Ceremony followed by Reception

2:30 p.m.—Reference Committees

5:00 p.m.—JEMPAC Political Forum

5:45 p.m.—JEMPAC Wine and Cheese Reception

Saturday, April 30, 1988

8:00 a.m.—Registration Opens

8:00 a.m.—Message Center Opens

8:30 a.m.—Exhibits Open

9:00 a.m.—House of Delegates

1:30 p.m.—House of Delegates

6:00 p.m.—Inaugural Reception followed by Inaugural Dinner

Sunday, May 1, 1988

8:00 a.m.—Registration Opens

8:00 a.m.—Message Center Opens

8:30 a.m.—Program on one topic of major interest to the physician

1:00 p.m.—Board of Trustees' Meeting

Unfinished Business . . .

(1) Membership Roster . . . Noted Doctor Cherashore's suggestion that a list of MSNJ members in each hospital be made available to those physicians on each hospital medical staff willing to match that list with a current list of physicians on their staff; this effort is directed to increasing membership.

(2) Medical Malpractice Reinsurance Association Deficit . . . Noted that the Commissioner of Insurance is close to making a decision on how to handle the medical malpractice deficit of \$40 million; MSNJ members will be advised of all actions.

(3) Tort Reform . . . Noted that the Senate Judiciary Committee has indicated that the tort reform bills will be on the agenda of their next meeting or the one immediately following.

(4) Moment of Silence . . . Observed a moment of silence in tribute to the memory of Mr. Richard I. Nevin, former Executive Director of MSNJ, who died on October 28, 1987.

Correspondence . . .

(1) MAAC Program . . . Received and noted information from the AMA stating that their Board of Trustees drafted legislation to seek repeal of the MAAC (maximum allowable actual charge) and the participating physician program.

(2) Nursing Shortage . . . Received and noted correspondence from the Commissioner of Health indicating the Departments of Health and Insurance have convened a study group to review the various factors contributing to the nursing shortage.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D.

During the past year, UMDNJ has undertaken an intensive effort to identify what it will need to do to meet Governor Kean's challenge to become one of the nation's top 25 health sciences universities by the turn of the century.

Until the beginning of this decade the characteristics of a top-ranked health sciences center were clear-cut: an excellent educational program, an extensive, well-funded research program, and a prestigious teaching hospital offering a com-

plete range of sophisticated specialized services. While these factors still are of major importance, economic and social trends dictate that academic health centers also must be prepared to excel within a new set of criteria, if they are to survive and thrive in the 21st century.

Participation in the development of a sound and comprehensive system for providing health services to the poor and the aged has emerged as a critical factor for a leading health science university. The institutions that attain top ranking will be those which can establish themselves as the core of a balanced, stable regional health care system. With the health industry's increasing emphasis on cost containment and competition, this will require taking a leadership role in developing the systems and mechanisms for providing adequate services to the needy. New initiatives begun by UMDNJ in 1987 include:

- With a \$600,000 grant from the Robert Wood Johnson Foundation, UMDNJ-New Jersey Medical School opened the first school-based health clinic for teenagers at Newark's Barringer High School. In addition, University Hospital's Maternal and Infant Care program collaborated with the Urban League of Essex County to establish a prenatal clinic for

pregnant teenagers at the Chestnut Street School.

- UMDNJ-School of Osteopathic Medicine established a program to track the effects of environmental hazards on pregnant women.

- UMDNJ-New Jersey Dental School launched a program with the Newark Board of Education to provide regular dental checkups to elementary school children.

- UMDNJ took on the operation of the ambulance service for the City of Camden as an extension of its University Hospital Emergency Medical Services in Newark.

- UMDNJ-Community Mental Health Center at Piscataway initiated the Student Assistance Program to provide drug and alcohol abuse counseling to students at Middlesex County high schools.

- The Eric B. Chandler Health Center was opened in New Brunswick by UMDNJ-Robert Wood Johnson Medical School and its core hospital to provide community-based family care to local residents.

All of the elements New Jersey needs for urban redevelopment—improved educational systems, development of new housing, and stimulation of new business ventures—are dependent upon adequate health care systems within the cities to ensure a healthy urban

ARE YOU MOVING?

environment and a strong, productive workforce. UMDNJ will continue to work with state and local agencies to play a role in the development of a comprehensive health care system to serve New Jersey's cities.

MSNJ Auxiliary

Mrs. Sally Ilagan

In this age of medical practice crisis, we no longer can be apathetic toward government intervention in the practice of medicine. Everything you and I do affects what the government imposes upon medicine today. The bureaucracy is taking away your rights on how to treat your patients.

Medical malpractice insurance still is on the rise and putting some specialties out of practice.

In reading these statements you probably are saying, "What is she telling me, that I don't already know?" That may be true, but what are you and your spouse attempting to do about the situation? You no longer can say you don't have the

photo: Mrs. Donald E. Sly

time. As a medical family, you must make the time.

One of the first things we all can do is happily participate in membership in the Medical Society of New Jersey and the Auxiliary. Power is in numbers. We can be our own public relations. Persuade the younger

physicians and spouses what continued membership in both societies can accomplish. We must use all that we have in our power to improve the image of the medical family.

Don't be one of the persons depicted in the photograph. Let us keep our heads out of the sand and face reality.

Get the message to your spouse. We have something to offer and your spouse has expertise to offer the Auxiliary. Impress upon your spouse the importance of membership—active and passive. The practice you save may be your own.

Don't hesitate. Call the Medical Society of New Jersey Auxiliary at 609/896-1766.

**CANDIDATES FOR
MSNJ OFFICES**

If you are interested in becoming an Officer, Trustee, or member of the AMA Delegation, a new opportunity exists for you.

The Nominating Committee will meet several times this year to consider candidates. We will consider members other than those recommended by county medical societies and nominating delegates for any of these offices.

If you wish to be considered, please contact your county medical society or the Medical Society of New Jersey for the necessary forms.

This is a real opportunity for grassroots candidate development and we urge you to use it.

New Members

The Medical Society of New Jersey would like to welcome the following new members:

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ANESTHESIOLOGY—Daniel O'Brien, M.D., 12 Beech Dr., Brunswick, ME 04011. Liege (Belgium) 1975. Board certified. Group, partnership, solo. Available.

ENDOCRINOLOGY—Alex Stewart Stagnaro-Green, M.D., 228 Voorhis Ave., River Edge, NJ 07661. Mount Sinai 1983. Also, internal medicine. Board eligible. Board certified (IM). Partnership, group, solo. Available July 1988.

FAMILY MEDICINE—William B. Glenn, D.O., 2 Raintree Way, Havelock, NC 28532. Philadelphia College 1980. Board certified. Group, partnership, solo. Available July 1988.

GASTROENTEROLOGY—Joel H. Kurtz, M.D., 2600 Netherland Ave., Apt. 2811, Riverdale, NY 10463. UMDNJ 1983. Board eligible. Partnership or group. Available July 1988.

HEMATOLOGY—Marta Meyers, M.D., 128 Hempstead Ct., Madison, NJ 07940. Medical College of Pennsylvania 1981. Also, internal medicine. Board certified. Group or partnership. Available.

INTERNAL MEDICINE—Robert P. Beswick, M.D., 2316 W. Cortez St., Chicago, IL 60622. Illinois 1981. Board certified. Group, partnership, clinic, industry. Available.

Glenn A. Dubov, M.D., 75-36 Bell Blvd., Apt. 2A, Bayside, NY 11364. Chicago 1983. Board certified. Also, nephrology. Group or partnership. Available July 1988.

Kathy Rosen Kerr, M.D., 318 Perrine Ave., Piscataway, NJ 08854. UMDNJ 1984. Also, pediatrics. Board eligible. Partnership or small group. Available July 1988.

Daniel R. Massarelli, M.D., 98 Longfellow Rd., Worcester, MA 01602. Georgetown 1985. Board eligible. Group, partnership, solo. Available September 1988.

Marta Meyers, M.D., 128 Hempstead Ct., Madison, NJ 07940. Medical College of Pennsylvania 1981. Also, hematology. Board certified. Group or partnership. Available.

Leilani L. Nixon, M.D., 1175 Gail Dr.,

Buffalo Grove, IL 60089. Illinois 1985. Board eligible. Partnership or solo. Available July 1988.

Sarva Daman Singh, M.D., 26 Carlson Ct., Closter, NJ 07624. Agra (India) 1978. Board eligible. Group or partnership. Available March 1988.

Samuel J. Stepanow, M.D., 430 W. Browning Rd., Apt. S-5, Bellmawr, NJ 08031. Hahnemann 1985. Board eligible. Group or partnership. Available July 1988.

Darius Sypek, M.D., 154 Oakwood Ave., Apt. 3, Cliffside Park, NJ 07019. Medical Academy (Poland) 1984. Board eligible. Group. Available July 1988.

Alex Stewart Stagnaro-Green, M.D., 228 Voorhis Ave., River Edge, NJ 07661. Mount Sinai 1983. Also, endocrinology. Board certified. Board eligible (ENDOCRIN). Partnership, group, solo. Available July 1988.

NEPHROLOGY—Glenn A. Dubov, M.D., 75-36 Bell Blvd., Bayside, NY 11364. Chicago 1983. Also, internal medicine. Board certified (IM). Group or partnership. Available July 1988.

OPHTHALMOLOGY—James Scott Lewis, M.D., 531 Sprague Rd., Narberth, PA 19072. Jefferson 1982. Group, partnership, solo. Available.

ORTHOPEDIC SURGERY—Richard Lebovitz, M.D., 707 Abbott St., Highland Park, NJ 08904. Downstate 1979. Board eligible. Partnership or solo. Available.

PEDIATRICS—Sheth Amit, M.D., 1305 E. 18 St., Brooklyn, NY 11230. N.H.L. Municipal (India) 1982. Board eligible. Group, partnership, solo. Available July 1988.

Meera Gupta, M.D., 57 Lawrence Dr., Berkeley Heights, NJ 07922. Nehru Medical College (India) 1977. Board eligible. Group or partnership. Available.

Kathy Rosen Kerr, M.D., 318 Perrine Ave., Piscataway, NJ 08854. UMDNJ 1984. Also, internal medicine. Board eligible. Partnership or small group. Available July 1988.

RADIOLOGY—Charles Saniewski, M.D., 9261 E. Bay Harbor Dr., #8, Bay Harbor, FL 33154. Rome 1983. Board eligible. Group or partnership. Available July 1988.

SURGERY—Victor B. Lebedovych, M.D., 211 S. Crapo St., Mt. Pleasant, MI. Michigan 1968. Board certified. Partnership or association. Available.

Ramiro Requena, M.D., Interfaith Medical Center, 555 Prospect Place, Brooklyn, NY 11238. Bolivia 1966. Board certified. Group, partnership, solo. Available.

UROLOGY—Charles Dorfman, M.D., 3313 Amherst Rd., Erie, PA 16506. Universidad Central del Este (Mexico) 1980. Board eligible. Group or partnership. Available July 1988.

NINTH ANNUAL MINIRESIDENCY IN OCCUPATIONAL MEDICINE

UNIVERSITY OF MEDICINE AND
DENTISTRY OF NEW JERSEY

DEPT. OF ENVIRONMENTAL AND COMMUNITY MEDICINE
ROBERT WOOD JOHNSON MEDICAL SCHOOL
PISCATAWAY, NEW JERSEY 08854

DATE:

May 2-20, 1988/15 weekdays/8:30 a.m.-4:30 p.m.,
6 evening classes/6:30-8:30 p.m.

PURPOSE:

To provide a comprehensive review of key concepts in Occupational Medicine given by eminent specialists from university, government and industry. To aid in obtaining board eligibility and certification.

ACCREDITATION:

The University of Medicine and Dentistry of New Jersey-Office of Continuing Education certifies that this continuing medical education activity meets the criteria for 90 hours of credit in Category I for the Physician's Recognition Award of the American Medical Association, provided the program is completed as designed.

SUBJECTS:

Industrial Hygiene, Occupational Disease, Toxicology, Practice of Occupational Medicine, Epidemiology and Biostatistics, Ergonomics, Public Health Administration.

INQUIRIES: Patricia Reid (201) 463-4707
UMDNJ-Office of Continuing Education
675 Hoes Lane, Piscataway, N.J. 08854-5635

THE ACADEMY OF MEDICINE OF NEW JERSEY
in cooperation with
THE MEDICAL COLLEGE OF PENNSYLVANIA
&
THE PHILADELPHIA GERIATRIC CENTER
presents

THE CHALLENGE OF THE GERIATRIC PATIENT: A CLINICAL APPROACH

on
WEDNESDAY, FEBRUARY 24, 1988
9:30 A.M.-4:15 P.M.

at
TRUMP PLAZA HOTEL AND CASINO
ATLANTIC CITY, NEW JERSEY

GOALS:

This symposium is designed to:

- Provide a context in which clinicians can think differently about preventative health and medical problems of the elderly.
- Provide new information that will be helpful in the diagnosis and management of diseases in the elderly.

OBJECTIVE:

- Participants will be able to integrate new developments in geriatrics with their current knowledge to manage their elderly patients more effectively.

JOEL POSNER, M.D.

Symposium Chairman

Medical Director, Philadelphia Geriatric Center

Associate Professor of Medicine

Chief, Division of Geriatrics

Medical College of Pennsylvania

MSNJ 1/88

The following is a list of continuing medical education courses for the next two months. Contact the sponsoring organization for further information.

This list is compiled through the cooperation of the Committee on Medical Education of the Medical Society of New Jersey, The Academy of Medicine of New Jersey, the New Jersey Chapter of the American Academy of Family Physicians, and the Office of Continuing Medical Education of UMDNJ. For information on accreditation, please contact the sponsoring organization(s), indicated by italics—last line of each item.

ANESTHESIOLOGY

February

- 6 **Eighth Annual Clinical Anesthesia**
8 A.M.—4:30 P.M.—New Jersey Medical School, MSB, B-552, Newark (UMDNJ)

March

- 2 **Does Choice of Anesthetic Make a Difference?**
8-8:50 A.M.—Robert Wood Johnson Medical School, MEB-593, New Brunswick (UMDNJ)
- 12-13 **29th Annual Postgraduate Anesthesia Seminar**
Hyatt Hotel, Cherry Hill (New Jersey State Society of Anesthesiologists)

CARDIOLOGY

February

- 1 **Advanced Cardiac Life Support**
- 2 **Provider Course**
- 4 New Jersey Medical School, MSB,
- 29 B-648, Newark (UMDNJ)
- 17 **Antiarrhythmic Drugs, VPCs—When To Treat**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)

March

- 1 **Advanced Cardiac Life Support**

- 3 **Provider Course**
- 28 New Jersey Medical School, MSB,
- 29 B-648, Newark
- 31 (UMDNJ)
- 17 **New Approaches to the Management of Heart Failure**
5 P.M.—Fuld Auditorium, Somerset Medical Center, Somerville (Somerset Medical Center)

DERMATOLOGY

February

- 9 **Dermatology Lecture**
8-10 P.M.—Schering Corporation, Kenilworth (The Dermatological Society of New Jersey)
- 17 **Dermatology Conferences**
6-9 P.M.—Rutgers Community Health Plan, 57 U.S. Highway 1, New Brunswick (UMDNJ)

March

- 8 **Dermatology Lecture**
8-10 P.M.—Schering Corporation, Kenilworth (The Dermatological Society of New Jersey)
- 16 **Dermatology-I**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 16 **Dermatology Conferences**
6-9 P.M.—Rutgers Community Health Plan, 57 U.S. Highway 1, New Brunswick (UMDNJ)
- 23 **Dermatology-II**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 30 **Common Skin Disorders**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)

MEDICINE

February

- 1 **Rheumatology Staff Conference**
5:30-7 P.M.—Robert Wood Johnson Medical School, MEB-393, New Brunswick (UMDNJ)
- 3 **Other Sexually Transmitted Diseases**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 3 **Monthly Dinner Meeting**
6-9 P.M.—Holiday Inn, Newark Airport (AMNJ)

- 3 **Medical Grand Rounds, Endocrine Series**
- 10 11:30-1 P.M.—VA Medical Center,
- 17 East Orange (AMNJ)
- 24 3 **Interhospital Endocrine Conferences**
10 3:30-5 P.M.—Rotates between Newark Beth Israel Medical Center, University Hospital, VA Medical Center, and United Hospitals Medical Center (UMDNJ)

- 4 **Genetic Toxicology, From Theory to Practice**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 8 **Arthritis**
7-8 P.M.—Wallkill Valley General Hospital, Sussex (AMNJ)
- 8 **Abnormal Liver Function, Tests and Their Meaning**
2-3 P.M.—Forensic Psychiatric Hospital, Trenton (Forensic Psychiatric Hospital)
- 10 **Medical Grand Rounds**
- 17 10 A.M.—St. Mary Hospital,
- 24 Hoboken (St. Mary Hospital)
- 10 **Calcium Metabolism**
1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (AMNJ)
- 10 **Dinner Meeting: NJ Gastroenterological Society**
6:30 P.M.—Parsippany Hilton (NJ Gastroenterological Society)
- 10 **Seizures**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 16 **Regional Nephrology Conference Series**
4-5 P.M.—Robert Wood Johnson Medical School, MEB, New Brunswick (UMDNJ)
- 18 **Family Practice Conference**
- 29 12 noon—St. Mary Hospital, Hoboken (St. Mary Hospital)
- 18 **Laser Treatment of GI Hemorrhage and GI Carcinomas**
2-3 P.M.—John E. Runnells Hospital of Union County, Berkeley Heights (AMNJ)

- 19-21 **Allergy and Nutrition**
Sheraton, Orlando, Florida (Holy Name Hospital)
- 24 **New Drugs and Therapeutic Choices in HTN**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 25 **Benzene Metabolism and Effects**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 25 **Chronic Pain Management and Issues Related to Iatrogenic Addiction**
3-4 P.M.—Ancora Psychiatric Hospital, Hammonton (AMNJ)

March

- 2 **Drug Addiction: Chronic Pain Management and Other Issues**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (St. Mary's Hospital)
- 2 **Drug Interactions**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 3 **Disease Associated with Exposure to Asbestos**
4-6 P.M.—Coriell Institute, Camden

THE PHILADELPHIA HEART INSTITUTE
of Presbyterian-University of Pennsylvania Medical Center

CARDIOLOGY UPDATE ...

designed for the Physician and provides an intensive survey of the
current status of Clinical Cardiology ...

WEDNESDAY

FEBRUARY 3, 1988

3:00 to 5:00 PM

DIAGNOSIS AND MANAGEMENT OF CORONARY
HEART DISEASE: SPECIFIC SYNDROMES

MODERATOR: BERNARD L. SEGAL, M.D.

3:00-3:20	Silent myocardial ischemia	Robert Katz, M.D.
3:20-3:40	Coronary spasm	Norman Feinsmith, M.D.
3:40-4:00	Unstable angina	Jan R. Weber, M.D.
4:00-4:30	Case presentations	Howard Noveck, M.D.
4:30-5:00	Panel discussion	Joel A. Krackow, M.D.; Michael S. Feldman, M.D.

- No Registration Fee
- No Advance Registration Required
- CME Credits*

* * Refreshments Served Following Each Session * *

Scheie Eye Institute Auditorium
Presbyterian-University of Pennsylvania
Medical Center
39th and Market Streets

- 17-36th Annual Convention:**
- 20 Family Practice**
Bally's Park Casino Hotel, Atlantic City
- 18 Gastroenterology—Peptic Ulcer**
10:30-11:30 P.M.—Woodbridge Developmental Center (AMNJ)
- 24 Radon: Consequences of Human Exposure**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 24 Proper Use of Antibiotics**
1:30-2:30 P.M.—Hunterdon Developmental Center, Clinton (AMNJ)

NEUROLOGY

February

- 3 Alzheimer's Disease**
10-11 A.M.—Green Brook Regional Center (AMNJ)

March

- 9 Alzheimer's Disease**
1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (AMNJ)

OBSTETRICS/GYNECOLOGY

February

- 21-Obstetrics/Gynecology Update**
26 Topnotch at Stowe, Vermont (UMDNJ)

- 25-Annual Semmelweis-Waters**
- 27 Ob/Gyn Conference**
Resorts International Hotel, Atlantic City (UMDNJ)

ONCOLOGY

February

- 1 Hematology/Oncology Conference**
12 noon-1 P.M.—Robert Wood Johnson Medical School, MEB-108A, New Brunswick (UMDNJ)
- 2 Prostate Cancer**
7-8 P.M.—West Hudson Hospital, Kearny (West Hudson Hospital)
- 3 Scientific Dinner Meeting**
17 6:30-9:30 P.M.—The Manor, West Orange (AMNJ)
- 4 Tumor Board Conferences**
11 9-11 A.M.—Irvington General Hospital (Irvington General Hospital)
- 18 18**
- 25 25**
- 4 Genetic Toxicology**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 5 Cancer Research Colloquium**
12 12 noon-1:15 P.M.—New Jersey Medical School, MSB, G-506a, Newark (UMDNJ)
- 9 Renal Biopsy Conferences**
12:30-2 P.M.—Barnert Memorial Hospital Center, Paterson (Barnert Memorial Hospital Center)
- 11 Carcinogens and Anticarcinogens**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 17 Lung Cancer**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (AMNJ)
- 18 Differential Repair of Active and Inactive Genes in Mammalian Systems**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 18 Early Bladder Carcinoma—Management of Carcinoma in Situ and Small Lesions**
5-6:30 P.M.—Fuld Auditorium, Somerset Medical Center, Somerville (Somerset Medical Center)
- 25 Tumor Board Conferences**
12 noon—Newcomb Medical Center, Vineland (Newcomb Medical Center)
- 25 Benzene Metabolism and Effects**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)

March

- 2 Scientific Dinner Meeting**
16 6:30-9:30 P.M.—The Manor, West Orange (AMNJ)
- 30 30**
- 3 Tumor Board Conferences**
10 9-11 A.M.—Irvington General Hospital (Irvington General Hospital)
- 24 24**
- 31 31**
- 4 Cancer Research Colloquium**

- 11 12 noon-1:15 P.M.—New Jersey Medical School, MSB, G-506a, Newark (UMDNJ)**

Hematology/Oncology Conference

- 21 21**
12 noon-1 P.M.—Robert Wood Johnson Medical School, MEB-108A, New Brunswick (UMDNJ)
- 9 Ninth Annual Tumor Board Conference**
6-9 P.M.—MSNJ Headquarters, Lawrenceville (The Oncology Society of New Jersey)
- 10 Studies on the Mechanism of Action of 2, 3, 7, and 8—Tetrachlorodibenzo-P-Dioxin: Receptor-Mediated Toxicity**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 24 Tumor Board Conferences**
12 noon—Newcomb Medical Center, Vineland (Newcomb Medical Center)

ORTHOPEDICS

February

- 3 Biomechanics of the Spine**
10:30-11:30 A.M.—Christ Hospital, Jersey City (AMNJ)

PATHOLOGY

February

- 2 Renal Pathology Conference**
12 noon-1 P.M.—Robert Wood Johnson Medical School, New Brunswick (UMDNJ)
- 3 Pathology of Hemodialysis Patients**
10:30-11:30 A.M.—Christ Hospital, Jersey City (AMNJ)

March

- 1 Renal Pathology Conference**
12 noon-1 P.M.—Robert Wood Johnson Medical School, New Brunswick (UMDNJ)

PEDIATRICS

February

- 2 Case Conferences**
9 8-9 A.M.—Robert Wood Johnson Medical School, MEB-108A, New Brunswick (UMDNJ)
- 16 16**
- 23 23**
- 4 Pediatric Grand Rounds**
11 8:30-9:30 A.M.—Robert Wood Johnson Medical School, MEB-102, New Brunswick (UMDNJ)
- 18 18**

American College of Physicians presents 69th Annual Session March 3–6, 1988 Jacob K. Javits Convention Center

Medicine's foremost educational opportunity in the nation's most exciting city

- ☐ More than 200 presentations for a curriculum suited to your needs
- ☐ Critical findings in Molecular Biology and Clinical Medicine in six State of the Art lectures
- ☐ Pre-Session courses on critical care, geriatrics and infectious diseases
- ☐ Clinical controversies featured in 12 panel discussions
- ☐ Analyses that confront the social, ethical and environmental issues surrounding today's dilemmas

- ☐ Rewarding activities planned especially for family and guests

Request Your 1988 Scientific Program Guide

The Scientific Program Guide—with schedules, course and faculty lists, registration and housing information, and the family and guest program—enables you to plan the most valuable, personalized Session possible. Because many popular programs fill up quickly, you'll want to schedule your curriculum well in advance. Reserve your copy now by filling out and returning the request form.

The AIDS Controversy

AIDS Vaccine, Testing for AIDS

November 3, 1987

Dear Doctor Krosnick:

The article by Dr. Leon G. Smith and Mr. Richard E. Brennan, Esq., "AIDS Vaccine," in the October 1987 issue of *NEW JERSEY MEDICINE* is well written, and with the points made, follows a logical conclusion. However, it is a classic example of how an erroneous logical conclusion can be arrived at by false or only partially true premises and by omitting important information.

The authors' final conclusion is that inoculation against AIDS must be carried out on a nationwide basis. Their own modifier, however, dictates against this conclusion. I quote, "However, it would be appropriate to exempt those persons who show reasonable certainty that vaccination would seriously impair their well-being or cause their deaths."

Vaccines that have been tried and tested for years, such as small pox and DPT, are not without their liability and risk. Need I remind these individuals of the minor crisis that was created a few short years ago when DPT was in short supply because drug manufacturers ceased production of this vaccine because of liability?

The authors are proposing that the entire population be exposed to a vaccine with limited knowledge of

its potential complications and side effects. The authors are ignoring the fact that despite extensive testings, before releasing a drug or vaccination, the FDA requires years of widespread use in order for all complications and consequences to be revealed.

Mr. Brennan sites many court decisions supporting the premise that the state has an interest and a right in protecting the general health and safety of its citizens, collectively and individually. I find fault with the argument, however, that the constitutional rights of the majority of the citizens must be compromised to preserve the constitutional rights of the individuals in those few subgroups who are at high risk.

As of this date, there is no evidence to support the fact that AIDS can be transmitted via casual contact, and for this reason, I support the authors' contention that these people should not be isolated or ostracized from society. However, the fact remains that AIDS is transmitted by sexual and direct blood contact. I contend that the disease can be contained if these people modify their sexual and drug habits.

New York Mayor Edward Koch, in an interview, proposed that syringes and needles be made available to drug users in an attempt to curb the spread of AIDS. The proposal was found unacceptable and ineffective since drug users prefer to pass the needle around. Condoms are not 100 percent effective but they can substantially reduce the risk of transmission but are reported to be unacceptable to the sexually promiscuous because they reduce the pleasure of the sexual act.

I find fault with the conclusion that since these high-risk groups of people refuse to take steps to protect their own lives, those of us who are non-drug users and maintain monogamous relationships must be subjected to the risk and complications of AIDS inoculation.

I applaud all the court decisions protecting the constitutional rights of individuals; however, when one must choose between the constitutional rights of the majority and the constitutional rights of the few, how can one support a ruling for the latter, particularly in a democracy which, by definition, is ruled by the majority?

(signed) Frank Gingerelli, M.D.

Testing for AIDS

November 17, 1987

Dear Doctor Krosnick:

As the oldest medical society, MSNJ has an opportunity to lead the way to unpoliticize acquired immunodeficiency syndrome (AIDS) and treat it not as a civil rights problem but as a public health problem!

Some researchers have found for those who have AIDS and remain healthy after five years, the infection increases dramatically and the patients eventually die or eventually suffer AIDS-related dementia as reported at San Francisco Hospital.

In the United States, people at high risk of AIDS include heroin addicts, homosexual men, bisexual men, organ transplant recipients, blood recipients, prostitutes, sexually active heterosexuals including those who practice vagina-anal intercourse, and the sexual partners of all of the above. The last three groups may innocently or unknowingly spread the virus.

The cure or a vaccine may be at least a decade off since the virus mutates easily; meanwhile the toll is reaching epidemic proportions.

The economic effects will be staggering as the number of AIDS patients increases (average cost at least \$60,000 to \$100,000), with a loss of productive years since AIDS strikes people in the 20 to 40 age group; there will be increases in the costs of treating related complications such as ARC, tuberculosis, and dementia, in the costs of testing and educating the public, in research and development of treatments or a vaccine, and in waste in federal government in fighting the epidemic or possibly quarantining millions of carriers. In addition, there will be legal cost of suits and countersuits.

To add to our medical-legal nightmare, a current decision in North Carolina found AIDS to be a handicap (failure to comply with Section 504 of the Rehabilitation Act which prohibits discrimination by health providing facilities because of a handicap). The U.S. Supreme Court upheld this decision as well as one that tuberculosis is a handicap. This will lead to many more suits and countersuits which already have started.

Employers in many health facilities find themselves in a quandary as they may find themselves liable for a discrimination suit based on

handicap and need to have a responsibility to other employees and patients who, out of fear, will avoid these facilities which hospitals can ill afford.

We saw and heard at our Annual Meeting some of us who are opposed to mass testing, maintaining that there is no point in finding the victims of AIDS because there is no cure and there are false positives or negatives. This is a callous approach to a life-and-death situation!

Mass screening has been condemned by civil liberties' and gay rights' activists, and even the AMA; however, the issue of the health of society or civilization as a whole must be preserved no matter what the price. The social stigma should be less now that heterosexual males and females (as well as babies) are involved. Also, keep in mind how

this disease affects the nation's blood supply and organ donations.

The Centers for Disease Control is considering a recommendation that AIDS antibody testing be administered to all routine hospital admissions and marriage licenses. At present, this test is required for blood donors, military recruits, and state department and foreign service offices. To this, we must add prenatal tests. If the incidence of AIDS is found to be high or getting higher, then mass screening (repeated at certain intervals) should be done.

Preventative measures at present seem to be "information" about AIDS—using condoms and voluntary testing. How are we actually to know who and how many have this dread disease? Must we wait until they come down with the symptoms before the diagnosis is made? How

about the innocent contacts that might have been made?

We are dealing with a fatal communicable disease for which there is no vaccine or cure, and none in the foreseeable future. We must stop the spread! The cost of saving lives, no matter how great, is worth the inconvenience and price. Confidentiality is important but like syphilis, contacts must be traced. We have mandatory tests for rarer diseases; isn't it justified for one that potentially affects millions and is fatal?

MSNJ can be a leader by strongly recommending these tests be required. We have everything to lose in not protecting society from this scourge. Privacy and confidentiality should be protected but should not interfere with the protection to prevent control of this disease.

Current Surgery of the Heart; Pediatric Intensive Care; The Physician as Teacher; Functional Anatomy in Sports

Current Surgery of the Heart

Arthur J. Roberts, M.D., and C. Richard Conti, M.D., (eds). Philadelphia, PA, J.B. Lippincott Company, 1987. Pp. 343.

"The purpose of *Current Surgery of the Heart* is to identify and describe selected major advances related to the surgical treatment of heart disease." So state the editors, and to this end, they proceed with the assistance of 42 cardiologists, cardiac surgeons, and representatives of related specialties.

Laser coronary recanalization and cardiac fiberoptic endoscopy are reviewed although the latter still requires definition for its application and advantage over existing diagnostic methods. Experience with intraoperative balloon catheter dilation is documented. Mechanical assist devices for support of both left and right heart circulation are updated with the newer generation technology and biocompatibilities. The mechanical heart substitute, with its "bridge" capabilities for

cardiac transplantation, remains fraught with major morbidity and mortality. The need for accelerated investigative and fundamental research is emphasized. Cardiac transplant history and current state of the art are exceptionally well addressed and focus on patient selection, perioperative care, and newer immunosuppressive agents, specifically cyclosporine. Experience with heart-lung transplantation in selective patients is touched upon. Early primary corrective repair of congenital heart defects now is coming of age with favorable reports on long-term survivals and improved functional capabilities. Sophisticated analysis of electrophysiologic phenomena and their clinical counterparts with mapping techniques has allowed removal of predetermined arrhythmogenic foci for the treatment of atrial supraventricular and ventricular arrhythmias. Similarly, somatosensory-evoked potentials during thoracic aneurysm surgery have been determined to avert catastrophic paraplegia. Newer elaborate but smaller cardiac pacing systems are described in great detail. All therapeutic modalities for myocardial revascularization are discussed with indications of their relative efficacies. Myocardial protection, including historical development, mechanism of injury, hypothermia, cardioplegia, and reperfusion injury is a chapter to be highlighted for its completeness yet simplistic presentation.

These are but a few comments on the contents of this book, whose 24 chapters also include mitral valvuloplasty, newer valve prosthetics, and early myocardial revascularization in the evolving myocardial infarct. Computerized perfusion technology and cardiac anesthesia techniques, so vital to successful surgical outcome, are thoroughly discussed which helps facilitate the editors' emphasis on selected major advances that contributed to current state of the art. The editors are to be congratulated in selecting participants whose writings are clear, concise, complete, and nonrepetitive.

Current Surgery of the Heart is deserving of its title and should be read by all medicos who seek familiarity with the status of cardiac surgery, and its chartered and unchartered future.

Joseph Alpert, M.D.

Pediatric Intensive Care

Jeffrey P. Morray, M.D., (ed). Norwalk, CT, Appleton & Lange, 1987. Pp. 581.

For this volume, concise and useful pathophysiologic summaries are combined with classically organized comments on diagnosis and management, all arranged in a traditional anatomic-physiologic disease-oriented structure. This multi-authored text displays a regional orientation but the editor's introduction is careful to disclaim any attempt to provide a magisterial approach or a survey of diverse opinions. The contents, arranged by systems, deal with fluids, cardiovascular, central nervous system, pulmonary, hematologic, renal, gastrointestinal, endocrinologic, and infectious disease. Other divisions are concerned with ethical issues, trauma, pharmacology, and transport. The standard of expository prose is good. Medical clichés and jargon are not intrusive. Both sustained perusal of a section or dipping for particular points were comfortable to do.

Three general negative comments are worth stating. First, there is inconsistency among the chapters in the extent to which emergency care, as compared to intensive care, is described; one often wishes for a bit more of the former. Second, there is inconsistency in the extent to which the pragmatic specifics and therapies are described. Third, there was little enough said about the "care" in intensive care, and very little indeed about parents and families. One particular point: I could not find reference to tibial marrow infusion of fluids.

This book may be recommended to provide the young doctor with a reference for all the topics which it contains, and for the older doctor as a standard against which to compare his own thoughts and actions.

Avrum L. Katcher, M.D.

The Physician as Teacher

Thomas L. Schwenk, M.D., and Neal A. Whitman, Ed.D. Baltimore, MD, Williams & Wilkins, 1987. Pp. 203. (\$21.50)

How many of us recall, as students ourselves, the pedantic bores who lectured and put us asleep with

their monotonous slide presentations or speeches requiring little or no interchange or questioning in the darkened lecture hall? Remember the professors who came late to the meeting rooms with pompous excuses for their tardiness?

The Physician as Teacher is highly recommended for those involved with student groups. The preface of this small paperback says it all: physicians by definition are teachers; their knowledge and skills are needed by all medical students, nurses, and other health professionals and by civic groups in community, political or religious settings.

The purpose of this book is to help the physician become a better teacher by organizing his or her thoughts and methods of teaching.

Part One suggests the teaching

plan: methods of communication, discussion groups, feedback, evaluation and enhancement of understanding, and retention of facts and stimuli towards continued self study. At the conclusion of this part, the authors provide good examples for all of the different plans presented.

Part Two presents practical guidelines in setting up the didactic and clinical teaching exercises. Again, examples are given for lectures to small or large groups; discussion plans, teaching rounds in bedside or ambulatory settings. Hints on self improvement and creative methods of teaching complete the subject. An abundant bibliography is included at the end.

Do not face your next student group without first reading this fine text. Harry M. Poppick, M.D.

Functional Anatomy in Sports

Jurgen Weuneck, M.D. Chicago, IL, Year Book Medical Publishers, Inc., 1986. Pp. 220.

This book is aimed primarily at the athletic trainer and other nonmedical personnel and is essentially a basic anatomy text with emphasis on movement and the anatomical structures involved.

The latter chapters of the book relate various muscles to specific sports and how they function. The final chapter is devoted to muscle strength training and exercises.

The book is of only marginal interest to physicians, but is a good practical text for the athletic trainer and coach, and would be worth purchase by them.

Christine E. Haycock, M.D.

***Drs. Aronoff; Del Deo;
Geller; Glass; Graziano;
Kane; Krakower; Love;
McMahon; O'Rourke;
Pedowitz; Pierce;
Saracino; Stevenson***

Dr. Solomon Aronoff

Retired Jersey City allergist Solomon Aronoff, M.D., died on October 10, 1987, at the age of 73. Dr. Aronoff received his medical degree from the Faculty of Medicine, University of Edinburgh, Scotland, in 1938. He began practice in Jersey City after serving as a captain in the United States Army medical corps during World War II. He maintained this practice for over 25 years. Dr. Aronoff served as head of the allergy departments at Jersey City Medical Center, St. Francis Community Health Center, both in Jersey City, and St. Mary Hospital in Hoboken. A Diplomate of the American Board of Immunology and Allergy, Dr. Aronoff was a Fellow of the American Academy of Allergy, the American College of Allergy, the New Jersey Allergy Society, the American Association for Clinical Immunology and Allergy, and the New York Academy of Sciences. In 1984, the American College of Allergists honored him as one of four outstanding allergists in America. Dr. Aronoff was a member of our Hudson County component.

Dr. Nicholas V. Del Deo

Retired in Spring Lake Heights after many years of pediatric practice in Newark, Nicholas V. Del Deo,

M.D., died on September 22, 1987, at the age of 93. A native of Newark, Dr. Del Deo received his medical degree from Bellevue Hospital Medical College, New York, in 1918. He was affiliated with Columbus Hospital, St. Michael's Medical Center, and UMDNJ-University Hospital, all in Newark. From 1918 to 1920, he served as lieutenant in the United States Navy. Dr. Del Deo was a member of our Essex County component and of the American Medical Association. For his 50 years as a physician, Dr. Del Deo received the Medical Society of New Jersey's Golden Merit Award in 1968.

Dr. Samuel Geller

Retired specialist in internal medicine and allergy, Samuel Geller, M.D., died on October 18, 1986, at the age of 80. Born in Russia, Dr. Geller emigrated to the United States, and attended the University of Maryland School of Medicine, Baltimore, receiving his medical degree in 1932. He was a physician in the allergy clinic at United Hospitals Medical Center, Newark, while maintaining a private practice. Dr. Geller was an Associate Fellow of the American College of Allergists, and a member of our Essex County component and of the American Medical Association, as well as the New Jersey Allergy Society. For his 50 years of medical practice, Dr. Geller received the Medical Society of New Jersey Golden Merit Award in 1982.

Dr. Arthur M. Glass

After 45 years of maintaining a family practice in Camden, Arthur M. Glass, M.D., died on September 23, 1987, at the age of 74. Dr. Glass attended Hahnemann Medical College in his native Philadelphia, where he received his medical degree in 1949. He was a member of our Camden County component and of the American Medical Association.

Dr. Alexander J. Graziano

Retired pediatrician Alexander John Graziano, M.D., of Madison, died on September 20, 1987, at the age of 56. A native of Hoboken, Dr. Graziano received his medical degree from Georgetown University School of Medicine, Washington, D.C., in 1956. While maintaining a private practice in Cliffside Park for

many years, Dr. Graziano served on the staff of St. Mary Hospital, Hoboken. Before retiring in 1972, he was a physician with CIBA Pharmaceutical Company, Summit, for six years. Dr. Graziano served in the United States Army as captain from 1959 to 1961. He was a member of our Bergen County component and of the AMA.

Dr. Sydney H. Kane

Sydney H. Kane, M.D., a retired specialist in pediatrics and biostatistics, died on September 7, 1987, at the age of 70. Born in Philadelphia, Dr. Kane received his medical degree from Temple University School of Medicine, Philadelphia, in 1940. He maintained a private pediatric practice in Philadelphia from 1944 to 1968. As a consultant in pediatrics, Dr. Kane was affiliated with Frankford Hospital and Northeastern Hospital, both in Philadelphia. Dr. Kane was a research instructor in pediatrics for the Women's Medical College, Philadelphia. From 1968 until his retirement, he was manager of biostatistics system analysis for CIBA Pharmaceutical Company, Summit. Dr. Kane was a Fellow of the American Heart Association; he was a member of our Union County component and of the American Medical Association. During World War II, he attained the rank of first lieutenant in the United States Army.

Dr. Alvin H. Krakower

After years as a gynecologist in Paterson and Fair Lawn, Alvin Harold Krakower, M.D., died on September 30, 1987, at the age of 70. Born in Paterson, Dr. Krakower received his medical degree from the University of Arkansas School of Medicine, Little Rock, in 1941, specializing in gynecology and nutrition. He became affiliated with Barnert Memorial Hospital Center, Paterson, and was elected president of its clinical society in 1962. Dr. Krakower was a founding Fellow of the American College of Obstetricians and Gynecologists; he was a member of our Passaic County component, and of the American Medical Association. A veteran of World War II, Dr. Krakower served as a captain in the United States Army Air Force medical corps, before beginning private practice in 1947.

Dr. Elizabeth F. Love

Former hospital administrator Elizabeth Ford Love, M.D., retired in Medford, died on August 17, 1987, at the age of 94. Born in Moorestown, Dr. Love received her medical degree from the University of Pennsylvania School of Medicine, Philadelphia, in 1919. She became affiliated with Memorial Hospital of Burlington County, Mt. Holly, and was an administrator at Jeanes Hospital, Philadelphia, from 1941 to 1953. Active in the community, Dr. Love was a lecturer in social hygiene for the New Jersey Department of Health, and was school physician for the townships of Moorestown, Maple Shade, and Mt. Laurel. She was a member of the American College of Hospital Administrators, of our Burlington County component, and of the American Medical Association. In 1969, Dr. Love received the Medical Society of New Jersey's Golden Merit Award.

Dr. Edward F. McMahon

Retired since 1984 from his Newark psychiatry practice, Edward Frank McMahon, M.D., died on August 22, 1987, at the age of 70. Dr. McMahon was graduated from New York University Medical College, New York, in 1957. He was a consultant at Somerset Medical Center, Somerville, from 1973 until his retirement. Dr. McMahon was a member of our Essex County component, the American Psychiatric Association, and the Academy of Psychosomatic Medicine.

Dr. John P. O'Rourke

Retired since 1979, from 31 years of general practice in Lyndhurst,

John Philip O'Rourke, M.D., died on August 17, 1987, at the age of 61. A native of Lyndhurst, Dr. O'Rourke was graduated from New York University School of Medicine in 1954. He was affiliated with the General Hospital Center at Passaic, where he served as vice-chairman of the board of governors, member of the executive committee, and president of its staff. He was a member of our Passaic County component. Dr. O'Rourke served as a sergeant in the Army.

Dr. Paul Pedowitz

A specialist in obstetrics and gynecology, Paul Pedowitz, M.D., died on May 11, 1987, at the age of 70. Born in New York, Dr. Pedowitz received his medical degree from Long Island College of Medicine, Brooklyn, in 1941. He became affiliated with Newark Beth Israel Medical Center and UMDNJ-University Hospital, both in Newark, and Elizabeth General Medical Center. Dr. Pedowitz was a professor of obstetrics and gynecology at UMDNJ-New Jersey Medical School, Newark. He was a Diplomate in obstetrics and gynecology, and a Fellow of the American College of Surgeons and the American College of Obstetricians and Gynecologists. Dr. Pedowitz was a member of our Essex County component.

Dr. Michael A. Pierce

Neurosurgery specialist Michael A. Pierce, M.D., died at the age of 68 in March 1987. Dr. Pierce received his medical degree from Albany Medical College, New York, in 1944. He became affiliated with St. Mary's Hospital, Passaic, The Mountainside Hospital, Montclair, Columbus Hospital, Newark, St. Mary Hospital, Or-

ange, and Clara Maass Medical Center, Belleville. From 1945 to 1947, he served with the United States Army medical corps, emerging with the rank of first lieutenant. A Diplomate in neurological surgery, Dr. Pierce was a member of the Essex County component, and of the AMA.

Dr. Franklyn J. Saracino

Retired surgeon Franklyn John Saracino, M.D., of Sarasota, Florida, died on June 30, 1987, at the age of 77. Born in Newark, Dr. Saracino attended the Faculty of Medicine at the University of Rome, Italy, where he received his medical degree in 1937. From 1939 until his retirement eight years ago, Dr. Saracino was a physician and abdominal surgeon at West Hudson Hospital, Kearny. He also served there as secretary of the medical staff. Dr. Saracino was a Fellow of the American College of Abdominal Surgeons, and was a member of our Essex County component and of the American Medical Association.

Dr. Stuart S. Stevenson

Stuart Shelton Stevenson, M.D., one of the founders of Seton Hall College of Medicine, the predecessor of the present University of Medicine and Dentistry of New Jersey, died on July 28, 1987, at the age of 72. A specialist in pediatrics, Dr. Stevenson received his medical degree in 1939 from Yale University School of Medicine, Connecticut. He was the first professor and chairman of the Department of Pediatrics at Seton Hall College of Medicine, and was affiliated with Hague Medical Center, Jersey City. Dr. Stevenson was a Diplomate in pediatrics, and a member of our Hudson County component and of the AMA.

AUTHOR INFORMATION

New Jersey Medicine is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in New Jersey Medicine is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

DOES YOUR PRACTICE NEED A NEW PERSPECTIVE?

Look into Air Force Aerospace Medicine. As an **Air Force Flight Surgeon**, you will have a truly general practice in your office. In the air you'll fly with and observe air crew members—adding a new perspective to your medical career. You can be an Air Force Flight Surgeon. Leave the headaches of office overhead and paperwork. Enjoy 30 days of vacation with pay each year, time for your family, medical and dental care, low cost life insurance plus a generous noncontributory retirement program. Maybe it's about time to give your life a new perspective. Contact your nearest Air Force recruiter and examine your opportunities in aerospace medicine today! Call

Specify
Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows:

“Possibly” effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl/Roche) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur.

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

When brain and bowel conflict...

NLM 00662296

It's time for the Peacemaker.

In irritable bowel syndrome* anxiety can aggravate intestinal symptoms, which may further intensify anxiety — a distressing cycle of brain/bowel conflict. Librax intervenes with two well-known compounds. The Librium® (chlordiazepoxide HCl/Roche) component safely relieves anxiety. And Quarzan® (clidinium bromide/Roche) provides antisecretory and antispasmodic action to relieve discomfort associated with intestinal hypermotility.

Dual action — for peace between brain and bowel. Because of possible CNS effects, caution patients about engaging in activities requiring complete mental alertness. Specify Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl
and 2.5 mg clidinium bromide

*Librax has been evaluated as possibly effective as adjunctive therapy in the treatment of peptic ulcer and the irritable bowel syndrome.

Before prescribing, see complete prescribing information in SK&F LAB CO. literature or PDR. The following is a brief summary.

Contraindications: There are no known contraindications to the use of 'Tagamet'.

Precautions: While a weak antiandrogenic effect has been demonstrated in animals, 'Tagamet' has been shown to have no effect on spermatogenesis, sperm count, motility, morphology or in vitro fertilizing capacity in humans.

In a 24-month toxicity study in rats at dose levels approximately 9 to 56 times the recommended human dose, benign Leydig cell tumors were seen. These were common in both the treated and control groups, and the incidence became significantly higher only in the aged rats receiving 'Tagamet'.

Rare instances of cardiac arrhythmias and hypotension have been reported following the rapid administration of 'Tagamet' HCl [brand of cimetidine hydrochloride] injection by intravenous bolus.

Symptomatic response to 'Tagamet' therapy does not preclude the presence of a gastric malignancy. There have been rare reports of transient healing of gastric ulcers despite subsequently documented malignancy.

Reversible confusional states have been reported on occasion, predominantly in severely ill patients.

'Tagamet' has been reported to reduce the hepatic metabolism of warfarin-type anticoagulants, phenytoin, propranolol, chlorthalidone, diazepam, lidocaine, theophylline and metronidazole. Clinically significant effects have been reported with the warfarin anticoagulants; therefore, close monitoring of prothrombin time is recommended, and adjustment of the anticoagulant dose may be necessary when 'Tagamet' is administered concomitantly. Interaction with phenytoin, lidocaine and theophylline has also been reported to produce adverse clinical effects.

However, a crossover study in healthy subjects receiving either 'Tagamet' 300 mg. q.i.d. or 800 mg. b.i.d. concomitantly with a 300 mg. b.i.d. dosage of theophylline (Theo-Dur®, Key Pharmaceuticals, Inc.),

demonstrated less alteration in steady-state theophylline peak serum levels with the 800 mg. h.s. regimen, particularly in subjects aged 54 years and older. Data beyond ten days are not available. (Note: All patients receiving theophylline should be monitored appropriately, regardless of concomitant drug therapy.)

Lack of experience to date precludes recommending 'Tagamet' for use in pregnant patients, women of childbearing potential, nursing mothers or children under 16 unless anticipated benefits outweigh potential risks; generally, nursing should not be undertaken in patients taking the drug since cimetidine is secreted in human milk.

Adverse Reactions: Diarrhea, dizziness, somnolence, headache, rash. Reversible arthralgia, myalgia and exacerbation of joint symptoms in patients with preexisting arthritis have been reported. Reversible confusional states (e.g., mental confusion, agitation, psychosis, depression, anxiety, hallucinations, disorientation), predominantly in severely ill patients, have been reported. Gynecomastia and reversible impotence in patients with pathological hypersecretory disorders receiving 'Tagamet', particularly in high doses, for at least 12 months, have been reported. Reversible alopecia has been reported very rarely. Decreased white blood cell counts in 'Tagamet'-treated patients (approximately 1 per 100,000 patients), including agranulocytosis (approximately 3 per million patients), have been reported, including a few reports of recurrence on rechallenge. Most of these reports were in patients who had serious concomitant illnesses and received drugs and/or treatment known to produce neutropenia. Thrombocytopenia (approximately 3 per million patients) and a few cases of aplastic anemia have also been reported. Increased serum transaminase and creatinine, as well as rare cases of fever, interstitial nephritis, urinary retention, pancreatitis and allergic reactions, including hypersensitivity vasculitis, have been reported. Reversible adverse hepatic effects, cholestatic or mixed cholestatic-hepatocellular in nature, have been reported rarely. Because of the predominance of cholestatic features, severe parenchymal injury is considered highly unlikely.

A single case of biopsy-proven periportal hepatic fibrosis in a patient receiving 'Tagamet' has been reported.

How Supplied: Tablets: 200 mg. tablets in bottles of 100; 300 mg. tablets in bottles of 100 and Single Unit Packages of 100 (intended for institutional use only); 400 mg. tablets in bottles of 60 and Single Unit Packages of 100 (intended for institutional use only), and 800 mg. Tiltab® tablets in bottles of 30 and Single Unit Packages of 100 (intended for institutional use only).

Liquid: 300 mg./5 ml., in 8 fl. oz. (237 ml.) amber glass bottles and in single-dose units (300 mg./5 ml.), in packages of 10 (intended for institutional use only).

Injection: Vials: 300 mg./2 ml. in single-dose vials, in packages of 10 and 30, and in 8 ml. multiple-dose vials, in packages of 10 and 25.

Prefilled Syringes: 300 mg./2 ml. in single-dose prefilled disposable syringes.

Plastic Containers: 300 mg. in 50 ml. of 0.9% Sodium Chloride in single-dose plastic containers, in packages of 4 units. No preservative has been added.

ADD-Vantage® Vials: 300 mg./2 ml. in single-dose, ADD-Vantage® Vials, in packages of 25.

Exposure of the premixed product to excessive heat should be avoided. It is recommended the product be stored at controlled room temperature. Brief exposure up to 40°C does not adversely affect the premixed product.

'Tagamet' HCl [brand of cimetidine hydrochloride] Injection premixed in single-dose plastic containers is manufactured for SK&F Lab Co. by Travenol Laboratories, Inc., Deerfield, IL 60015.

* ADD-Vantage® is a trademark of Abbott Laboratories.

Investing made easier...

Endorsed by the
Medical Society of New Jersey

Investing is a complicated business...and no one knows this better than AMA Advisers, Inc. We're the investment organization interested in serving the investment needs of physicians nationwide with the full array of mutual funds in **The AMA Group**. We've been in the business for nearly twenty-five years and have successfully managed mutual funds since 1966. We pride ourselves on our money management expertise and experience.

You can build your investment program around **The AMA Group**, the mutual funds managed by AMA Advisers, Inc., designed to help you meet your financial goals with a broad choice of investment choices. Plus, we offer a full range of investor services, including our newest service, **Asset Investment Management (AIM)**, and, of course, professional management of the highest quality.

Investing need not be all that complicated. Let AMA Advisers show you how! Simply complete and mail the coupon for your **FREE** Information Kit on the funds in **The AMA Group**. We'll send you a

prospectus with more complete information detailing fees and expenses. Please read the prospectus carefully before you invest or send money.

Now for a limited time, you can also receive a FREE Investment Information Booklet provided by The Investment Company Institute when you respond.

LIBRIUM®

chlordiazepoxide HCl/Roche (V)

5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ototoxic or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and ocular roge) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Due to isolated reports of exocorbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ototoxic and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extropyromidal symptoms, increased and decreased libido, all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. **Oral—Adults:** Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. **Geriatric patients:** 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cords of 25, and in boxes containing 10 strips of 10. Librilabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

THE MEDICAL SOCIETY OF NEW JERSEY

VOLUME 51

AIDS POLICY

A licensee of the Board of Medical Examiners may not categorically refuse to treat a patient who has AIDS or AIDS-related complex, or an HIV positive blood test, when he or she possesses the skill and experience to treat the condition presented. Our licensees have long adhered to a tradition of care. The Centers for Disease Control guidelines, however, do recognize that health care workers with certain physical conditions which render them unduly susceptible to the virus should refrain from direct patient care. The Board will consider each case on an individual basis giving due consideration to any such extenuating circumstances. Of course, even where such extenuating circumstances may exist, the Board would hold that the licensee retains the responsibility to make alternative arrangements for the proper care of a patient. The Board is heartened that no complaint yet has been brought before it regarding such a refusal and we remain confident that our licensees are appropriately shouldering their responsibilities.

CAN YOU HELP?

Project USA, an AMA program to recruit fully licensed physicians for short-term, general medicine assignments at Indian Health Service and National Health Service Corps hospitals and clinics, have vacancies. Vacancies are from two to four weeks and occur in a variety of interesting locations. Participating physicians receive a stipend of \$750 a week plus round trip transportation and living accommodations. Interested physicians should contact John Naughton, AMA, 535 North Dearborn, Chicago, Illinois 60610.

PROPOSED MEDICARE CHANGES

1. **Rollback in physician payments.** Under the Senate Finance Committee package inspired and controlled by Office of Management and Budget (OMB) numbers, physician payments would be rolled back. There would be no update. This would be accomplished by leaving in place the already imposed 2.3 percent sequester cut. The only exception would be for primary care services, although it is not assured. Primary care services could be allowed the 3.6 percent MEI update on April 1, 1988. This update would be made from the current sequestration level; hence, the

final but postponed update for primary care services only would be 1.3 percent. In either case, no catch-up would be permitted.

2. **Lab fees to be slashed.** The Senate Finance package also provides for hefty cuts in the fee schedule for physician office and outpatient lab payments. The proposal under consideration would 1) cut payments 10 percentage points from 62 to 52 percent of prevailing charges with 2) the already scheduled CAP reduction from 115 to 110 percent of actual charges and 3) no 1.4 percent scheduled increase. It is estimated that approximately half of these cuts would be borne directly by physicians.

3. **Physician DRGs.** Proposals have been considered this year that would require inpatient radiology, anesthesiology, and pathology (RAP) services to be paid under the DRG system. We must point out again that physician DRGs would end up doing a great disservice for both doctors and their patients. We are indeed grateful that neither the House nor Senate bills provide for physician DRGs. The provision of the House Energy and Commerce Committee to prohibit the Secretary from implementing any system or demonstration for payment of RAPs through a DRG system recognizes specifically the adverse nature of such incentives (to reduce the amount of care provided to our elderly) in a medical care environment. That Committee's prohibition in the House bill should be maintained.

PATIENT AID FUND: ARTHRITIS FOUNDATION

Financial assistance is available to people with a primary and specific diagnosis of arthritis, who are under recognized medical care and where there is no third-party payment available and personal finances are limited. The maximum amount of funding allowed per person is \$200 a year. Funding is available for: self-help aids and devices, splints, prescription shoes, clothing alterations for the handicapped, and orthopedic equipment needed for long-term use and not available through Chapter's Loan Closet Program. This financial assistance program is made possible by the Jr. Woman's Club of Bloomfield and the Employees of Osteonics. This program currently is open to children under 18 years of age only, and has limited funds available. For further information call 201/388-0744 or 609/482-0600.

GOVERNMENTAL AFFAIRS UPDATE

by CLARK MARTIN

Answering the SCI Report. A better system for the Board of Medical Examiners to handle complaints while protecting the confidentiality of both the accused and the accuser is the Society's main response to the State Commission of Investigation's report on Impaired and Incompetent Physicians.

Released last November, the report made front-page headlines and prime time television news with its charge that a "small percentage of physicians who are impaired constitutes a potentially lethal minority," and that the Board of Medical Examiners neither has the information nor the staffing it needs to act effectively.

The SCI also criticized hospitals and health care professionals for engaging in a "conspiracy of silence" for not reporting physicians who are incompetent or impaired by alcohol, drug abuse, or some mental or physical disability.

To meet the challenges of the report, the Society retained as special counsel Herbert J. Stern, who won national recognition as United States District Court Judge and as United States Attorney for New Jersey. With him, we've met with the SCI to discuss reconsideration of some of its recommendations, testified at a public hearing before the Senate Committee on Institutions, Health and Welfare, and now are submitting our proposals to key legislators.

Our recommendations include:

- Reorganizing the State Board of Medical Examiners (SBME) to separate its adjudicatory and prosecutorial functions. Hence, the Board's legal counsel no longer would serve both as prosecutor and adviser to the Board on guilt, innocence, and penalties.

- Restructuring the SBME's disciplinary system into regional panels which initially would assess whether further action is warranted. Proceedings would be kept confidential and adverse decisions would be made public only after SBME final action. This is modeled after New Jersey's nationally acclaimed system for disciplining attorneys.

- Prohibiting the use in civil suits such as malpractice actions of any information given to the SBME, or any action taken by the Board. In other words, civil plaintiffs must develop their own facts. Attorneys today are given similar protection.

- Establishing a more detailed agreement between the SBME and MSNJ's Impaired Physicians Program to assure that the Board can assess the progress of enrollees while safeguarding confidentiality.

- Guaranteeing immunity from civil liability for those who report suspected impairment or incompetence.

Making Medicaid a Priority. "Human Services Commissioner Drew Altman called today for New Jersey to stop the further decline of the number of physicians and other medical professionals who care for Medicaid patients by increasing the fees they are paid under the State's Medicaid program." So goes the first sentence of a press release issued when Commissioner Altman

testified before the Assembly Health and Human Resources Committee. The date? November 17, 1986.

Now, some 15 months later, the Medicaid payment for physicians remains essentially the same as 15 years ago. This fact, complicated by reduced compensation for Medicare patients, no compensation for indigent patients, and the tremendous financial impact of AIDS treatment on inner city practitioners has created a crisis situation. As Commissioner Altman testified in 1986, Medicaid's "low rates of reimbursement for medical professionals are driving them away from serving Medicaid patients."

In 1988, to prevent a further loss of physicians serving Medicaid patients, the Society has made the program one of its top governmental affairs priorities. We'll be working with the commissioners of Human Services and Health and with key legislators in an attempt to establish rates which will help the Medicaid program realize its goal of assuring quality health care for the poor, encourage physician participation, and redirect patients to the continuing care of private physicians instead of receiving primary care—each time from a different doctor—in more costly hospital outpatient facilities and emergency rooms.

Senate Defeats Optometric Bill. The Society won a major legislative victory in mid-December when the Senate soundly rejected a bill which would authorize optometrists to diagnose disease and prescribe drugs.

The bill, S-2261 (Lynch, D-New Brunswick), received 13 "yes" and eight "no" votes while 15 senators abstained from voting. To pass, a bill needs 21 affirmative votes.

We've fought S-2261 and its predecessors for a number of years. These bills represent a dangerous concept which, unfortunately, has become law in some states: authorizing nonphysicians to practice medicine. S-2261 is not the only bill of its type in our Legislature. A similar measure permitting nurses to diagnose disease and prescribe drugs also was introduced in last year's Senate. Both the optometric and the nursing measures have been reintroduced in the new Legislature which convened last month.

The current Senate nearly is identical in membership to that which voted down the optometric drug bill. This gives our recent victory considerable relevance in the current session.

New Legislature Takes Office. Top leaders of the 1988-89 Legislature are the same as in the past two years. Democratic Senate President John Russo (D-Toms River) and Republican Assembly Speaker Chuck Hardwick (R-Westfield) were re-elected by their majority parties following the November 3, 1987, election. The Democrats gained 1 Senate seat, bringing their majority to 24-16. Democrats also gained 8 seats in the Assembly where Republicans hold a 42-38 edge.

The Society's political action committees, MedAc and JEMPAC, contributed \$180,000 to incumbents and challengers in the 1987 legislative elections.

GOVERNMENTAL AFFAIRS UPDATE

by CLARK MARTIN

Of the 120 legislators serving in the current session, 113 received organized medicine's support. Thanks to the tireless efforts of JEMPAC/MedAc Chairman William E. Ryan, M.D., our political action has become a significant factor in helping us attain a stronger position in the Legislature. To the many members who contributed to our PACs and who took the time to discuss issues with their legislative candidates, many thanks!

"Verified" Bills No Longer Needed. Physicians no longer have to "verify that their services were necessary and were, in fact, furnished" when they bill insurance companies. The cumbersome requirement was deleted from state insurance laws by A-3434, which took effect immediately when Governor Kean signed it on December 28. Sponsor of the new law, which in effect recognizes the advent of electronic billing, is Assemblyman Ralph Loveys (R-Parsippany).

INSURANCE BAILOUT: WHOSE RESPONSIBILITY?

MSNJ and the Medical Inter-Insurance Exchange will use every remedy available, including court action, to defeat the State Insurance Department's confiscatory plan to bail out its now defunct Medical Malpractice Reinsurance Association. The plan was announced early last month.

The Department wants to levy a 4 percent surcharge for an estimated seven years on the professional liability insurance premiums of every physician, podiatrist, and chiropractor in the state in order to pay off the deactivated plan's \$60 million debt. It estimates that the surcharge would cost a general practitioner \$232 and an obstetrician \$1,259 per year.

The Society believes that the Insurance Department does not have the legal authority to enact the plan. The state-run Medical Malpractice Reinsurance Association operated for five years after its activation in 1977 under a law which required the insurance commissioner to "make a finding that medical malpractice liability insurance is not readily available." The fact is that such insurance was readily available in 1977 and the plan was activated solely to create what then-Commissioner James Sheeran felt would be a more competitive market.

Because the state plan sold insurance for unreasonably low premiums—in effect, it was undercutting the Medical Inter-Insurance Exchange—it now is in debt. It holds \$22 million in reserve and anticipates \$82 million in claims over the next decade.

Now the Department proposes that the thousands of physicians who paid more to purchase coverage from the Exchange or from other carriers be further charged for claims against beneficiaries of the State's "bargain."

The Society believes that the deficit should be met either from the state budget or from a surcharge on the 3,300 physicians and 450 podiatrists who purchased the underpriced insurance from the state plan.

PROPOSED RULE MAKING: FAMILY PLANNING CODES

The Division of Medical Assistance and Health Services has submitted a proposal to the *New Jersey Register* which is designed to increase fees for family planning services rendered by independent clinics. The procedure codes affected by the proposed increase include initial visit, followup visit, and revisit. The full text of the rule will appear in a future issue of the *New Jersey Register*.

HEALTHSTART

The Department of Human Services, and the Division of Medical Assistance and Health Services has submitted a proposal which appeared in the November 2, 1987, issue of the *New Jersey Register* at 19 N.J.R. 1978(a). The proposal was submitted in cooperation with the New Jersey Department of Health. The proposal is designed to implement a program of comprehensive maternal and child health care for all pregnant women and dependent children under two years of age in New Jersey who are eligible for Medicaid benefits. This program shall be known as HealthStart. The proposal explains who could qualify as a HealthStart provider, the service package, and the reimbursement schedule. The full text of the proposal has been printed in the *Register*.

BEWARE

A member of the Medical Society of New Jersey has filed a consumer fraud complaint regarding a linen service company that has been soliciting MSNJ physicians. Apparently, the company promises more than they deliver. It is suggested that any physician being offered a free, one-month trial service introductory offer of office linens needs to thoroughly examine the proposal before committing himself.

PREMIUM RATE RENEWALS

Each year it is necessary to adjust the premium rates for the MSNJ insurance programs to reflect expected claim payments, reserves, and administrative expenses for the coming year. The enclosed premium notice includes premium adjustments effective January 1, 1988, as summarized below:

Blue Cross/Blue Shield. The recent claims experience of participants under age 65 has been extremely high. As a result, the Blue Cross/Blue Shield requested an average rate increase of 33 percent effective January 1, 1988. After lengthy negotiations, and by using surplus funds from the 1986 coverage year, the Committee was able to lower the average increase to 25.34 percent. Because the actual increase varies by program and type of contract, participants' individual rate increase may be more or less than 25.34 percent.

Premium rates for persons age 65 and over no longer are set by the New Jersey Insurance Commissioner. Projected costs for all participants now are determined from the combined claims experience of those under age 65 and those age 65 and over. Separate premium rates then were established for each age group according to actuarial studies derived from the Blues' own claims records. These studies found that past premium rates for persons age 65 and over were much too low to cover actual claim costs. The new method of determining premium rates for this age group has resulted in a significant rate increase effective January 1, 1988.

Major Medical. The most recent claims experience of participants in the MSNJ Major Medical program continues to exceed paid premiums.

Due to the spiralling claim costs, premium rates must be increased by an average of 34 percent effective January 1, 1988. This large rate hike is needed to cover the program's anticipated claims over the next year.

Dental. The claims experience under the MSNJ dental program was much lower than expected for the nine-month period ended December 31, 1986. As a result, a refund of almost 25 percent of premiums will be returned to participants in approximately 90 days.

Despite the favorable claims experience during the 1986 coverage year, program costs in 1988 are projected to rise and a 9 percent premium increase took effect January 1, 1988. This increase follows last year's 12 percent decrease so that participants' cost for dental insurance still is lower than it was in 1986.

Comments. The Committee recognizes that this year's Blue Cross/Blue Shield and Major Medical increases are substantial. The increases do, however, reflect the overall utilization of benefits by participating members.

Despite the apparent need for justifiable rate increases, the Committee is pursuing alternatives to the current programs. In the coming months, the Committee will review health care insurance programs available through commercial insurers that may be interested in underwriting the MSNJ group. Other options that will be investigated include self-insurance, alternative funding arrangements, and various cost containment initiatives.

Participants will be kept advised of all future developments concerning the MSNJ Health Care Insurance programs. If you have any questions on your new premium rates, please contact Donald F. Smith & Associates' Insurance Administration Department at 609/924-8700.

UNDERWRITING CHANGES

In conjunction with the 1988 premium rate renewal, the Blues have implemented a number of underwriting changes in the MSNJ Blue Cross/Blue Shield and Major Medical programs. The changes affect current participants as well as individuals considering participation. If you currently are enrolled in the MSNJ program or intend to enroll in the future, please read the following information carefully:

The underwriting changes include:

1. As of April 1, 1988, the Blue Shield Series 500, 750, and 14/20 fixed-fee payment schedules no longer will be offered to new participants or as an upgrade

to current participants. Although a final decision has not been made yet by the Blues, it is expected that these fixed-fee plans will be eliminated entirely by January 1, 1990. At that time, all participants would be enrolled under the Blue Shield P.A.C.E. program.

2. On January 1, 1988, Blue Cross/Blue Shield eliminated the Husband and Wife contract class. Participants who now are covered under Husband and Wife contracts will be enrolled for Family coverage. A new premium rate for Family contracts was developed by combining the claims data of both classes. The change produces a slightly higher rate than a Husband and Wife contract calculated under the old method and a slightly lower rate for a Family contract.

3. As of April 1, 1988, individual participants must be enrolled for the same contract class (i.e. Single or Family) for both Blue Cross/Blue Shield and Major Medical. For instance, participants no longer may enroll for Single coverage under Blue Cross/Blue Shield and Family under Major Medical. It must be one contract class for both coverages. Individuals with Parent and Child(ren) Blue Cross/Blue Shield coverage must be enrolled for Family Major Medical coverage.

4. Beginning April 1, 1988, new participants will be offered Blue Cross/Blue Shield and Major Medical as a single, packaged plan. The coverages will not be available separately. Participants who now have Blue Cross/Blue Shield coverage only can maintain that coverage by itself. Persons age 65 and over will not be eligible to enroll.

Currently, individuals age 65 and over are permitted to enroll in the MSNJ Blue Cross/Blue Shield program only. As of April 1, 1988, this no longer will be permitted. If you are in this age category and intend to enroll in the Blue Cross/Blue Shield program, you must do so prior to April 1, 1988.

Also effective April 1, 1988, participants with Blue Cross/Blue Shield and Major Medical must maintain both coverages to participate. It no longer will be permitted to terminate participation in the Major Medical program and retain the Blue Cross/Blue Shield plan only.

5. On April 1, 1988, minimum participation requirements will be applied to all participating employer units. This means a certain percentage of eligible persons must participate in order for coverage to be made available. If the employer unit cannot achieve the minimum participation level, coverage would not be extended to that particular employer unit.

For current participants, MSNJ Insurance Program records will be reviewed for compliance with the consistent enrollment and minimum participation requirements. Members that do not comply will be contacted by Donald F. Smith & Associates to discuss compliance alternatives.

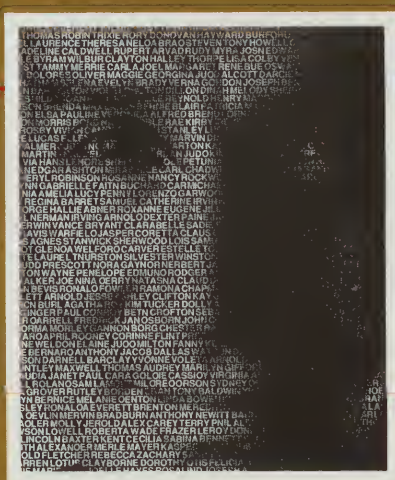

If you have any questions on the MSNJ health insurance programs or the new underwriting changes being implemented, please contact Donald F. Smith & Associates' Administration Department at 609/924-8700.

...like the more than one million patients who have received **INDERAL® LA**.

In a recent survey, 4,120 participating physicians gave us their views¹ on **INDERAL LA** in the treatment of hypertension, angina and migraine.

INDERAL LA is their preferred beta blocker

...of the nearly three out of four physicians responding to the questionnaire, an impressive 97% rated **INDERAL LA** good to excellent for overall performance. Virtually all cited efficacy, tolerability, long-term cardiovascular protection and once-daily convenience as important factors in their choosing to prescribe **INDERAL LA**.

INDERAL LA promotes patient compliance

...Virtually every responding physician rated patient satisfaction with **INDERAL LA** to be as good as, or better than, other beta blockers.

Like conventional **INDERAL** Tablets, **INDERAL LA** should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree and bronchial asthma.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION, SEE PACKAGE CIRCULAR.)

INDERAL[®] LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. INDERAL LA is formulated to provide a sustained release of propranolol hydrochloride. INDERAL LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. INDERAL is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by INDERAL, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

INDERAL LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with INDERAL LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of INDERAL Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

INDERAL LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to INDERAL LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, INDERAL LA has been therapeutically equivalent to the same mg dose of conventional INDERAL as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure, and rate pressure product. INDERAL LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. **Hypertension:** INDERAL LA is indicated in the management of hypertension; it may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. INDERAL LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: INDERAL LA is indicated for the long-term management of patients with angina pectoris.

Migraine: INDERAL LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: INDERAL LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. INDERAL LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. INDERAL is contraindicated in 1) cardiogenic shock; 2) sinus bradycardia and greater than first-degree block; 3) bronchial asthma; 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with INDERAL.

WARNINGS. **CARDIAC FAILURE:** Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or INDERAL should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of INDERAL therapy. Therefore, when discontinuance of INDERAL is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If INDERAL therapy is interrupted and exacerbation of angina occurs, it is usually advisable to reinstitute INDERAL therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema)—PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. INDERAL should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY: The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

INDERAL (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOGLYCEMIA: Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS: Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 , and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. GENERAL: Propranolol should be used with caution in patients with impaired hepatic or renal function. INDERAL (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should be cautioned that INDERAL may interfere with the glaucoma screening test. Withdrawal may lead to a return in increased intraocular pressure.

CLINICAL LABORATORY TESTS: Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS: Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if INDERAL (propranolol HCl) is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncope, ataxia or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure, or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol. Ethanol slows the rate of absorption of propranolol.

Phenytin, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY: Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY: Pregnancy Category C. INDERAL has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. INDERAL should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS: INDERAL is excreted in human milk. Caution should be exercised when INDERAL is administered to a nursing woman.

PEDIATRIC USE: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular: Bradycardia; congestive heart failure; intensification of AV block; hypotension; paresthesia of hands; thrombocytopenic purpura; arterial insufficiency, usually of the Raynaud type.

Central Nervous System: Light-headedness; mental depression manifested by insomnia, lassitude, weakness, fatigue; reversible mental depression progressing to cataplexy; visual disturbances; hallucinations; vivid dreams; an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy, and vivid dreams appear dose related.

Gastrointestinal: Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic: Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory: Bronchospasm.

Hematologic: Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-immune: In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous: Alopecia, LE-like reactions, psoriasisform rashes, dry eyes, male impotence, an Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, sebaceous membranes and conjunctivae reported for a beta blocker (practolol) have not been associated with propranolol.

DOSEAGE AND ADMINISTRATION. INDERAL LA provides propranolol hydrochloride in sustained-release capsule for administration once daily. If patients are switched from INDERAL Tablets to INDERAL LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. INDERAL LA should not be considered a simple mg-for-mg substitute for INDERAL. INDERAL LA has different kinetics and produces lower blood levels. Retitration may be necessary especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION—Dosage must be individualized. The usual initial dosage is 80 mg INDERAL LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed to full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS—Dosage must be individualized. Starting with 80 mg INDERAL LA once daily dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE—Dosage must be individualized. The initial oral dose is 80 mg INDERAL LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, INDERAL LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS—80-160 mg INDERAL LA once daily.

PEDIATRIC DOSAGE—At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

Court Decisions

Right To Die Cases; Physician Liable for Another Physician?

NEW JERSEY SUPREME COURT DECIDES THREE RIGHT-TO-DIE CASES

The New Jersey Supreme Court, on June 24, 1987, decided three cases dealing with a patient's right to refuse or terminate treatment. Two of the cases, *In the Matter of Hilda M. Peter* (Docket No. A-78) and *In the Matter of Nancy Ellen Jobes* (Docket No. A-108/109) dealt with incompetent nursing home patients; the other case, *In the Matter of Kathleen Farrell* (Docket No. A-76) dealt with a competent, terminally ill patient being treated at home.

The court in the *Farrell* case concluded that judicial review is not appropriate unless there is some dispute between or among the family members, the treating physicians, and the patient him- or herself. In the case of the competent patient, there is no question that the patient's wishes must control. The caretaker will be protected from civil and criminal liability if it follows the guidelines laid down in the *Farrell* case as follows:

1. A determination must be made that the patient is competent.
2. The patient must be fully informed about his prognosis, the alternatives, and the risk in withdrawal or termination of the treatment in question.
3. The patient's choice must be voluntary and without coercion.
4. The patient's decision must be balanced against the four traditional state interests which could override a decision to terminate treatment. These are the preservation of life; the prevention of suicide; the protection of the integrity of the medical profession; and the protection of interests of innocent third parties. In the *Farrell* case and the other cases discussed below, the court stated repeatedly that it would be difficult to conceive of an instance where the state's interest in the preservation of life would supersede a patient's own desire to terminate life-prolonging medi-

cal treatment. Neither was suicide a question in these cases; it was the illness, not a suicidal intent, which would result in the patient's death. The integrity of the medical profession was not a question here, either. The treating physicians were in agreement with the decision to terminate treatment. The only remaining interest was the protection of innocent third parties. The court found that Mrs. Farrell's two minor sons would be well cared for by their loving father, and were in agreement with the termination of treatment.

5. The decision should be made by the patient and family with the advice of the treating physician. The court in the *Farrell* case was very strong on the involvement of family members in these types of decisions. It is significant to note that if there are close family members, it no longer is necessary in New Jersey to seek appointment of a guardian, even in the case of an incompetent patient.

6. If the patient is being cared for at home, two nonattending physicians should examine the patient to determine competency and the fact that the patient is fully informed of his prognosis, the risks of removal of the treatment, and the alternatives. The court noted as an aside that in a hospital, many people would be looking at the patient and that the prognosis committee often will be convened to confirm the medical diagnosis and prognosis.

As stated, the court in the *Farrell* case made it quite clear that caregivers who implement these procedures will not be subject to civil or criminal liability for the termination of life-prolonging treatment of a competent patient at the patient's request. The procedures to be followed in the case of an incompetent patient are somewhat more complex, and were dealt with in the *Peter* and *Jobes* cases.

Both cases involved nursing home patients, who had been diagnosed as being in a persistent vegetative state; in *Peter's* case, an elderly patient (65); in *Jobes's* case, a younger one (31). In these cases, the court clarified a number of troubling questions which can arise for health care providers.

Hilda Peter, while competent, had executed a power of attorney which specifically authorized a close friend to make all decisions with respect to her health, as if he were next of kin, to consent to medical treatment, and to manage and direct her medical care. Although not a model of clarity, this document did play an important role in the court's ultimate decision.

There came a point in time when Ms. Peter's close friend sought a court adjudication of Ms. Peter's incompetency, and authorization to withdraw medical care. The court declared Ms. Peter incompetent, but ordered that her friend make no decision to withhold or withdraw medical care or treatment without first notifying and obtaining the consent of the New Jersey Ombudsman for the Institutional Elderly. The friend desired to remove the nasogastric tube which was providing sustenance to Ms. Peter. The Ombudsman refused to consent, applying the standards set forth in the 1985 case *In re Conroy*, because medical examinations indicated that Ms. Peter would not die within

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects, respectively.

one year and this was a requirement in *Conroy*.

In this case, the court reaffirmed its statement in *Conroy* that an individual does not lose the right of self-determination when that individual becomes incompetent. However, the court indicated that a persistent vegetative state is substantively different than the terminal condition in which Ms. Conroy found herself, and, therefore, said that the standards applied must, to some extent, be different. Life expectancy of a patient in a persistent vegetative state is not an important criterion.

The court found clear and convincing evidence of Ms. Peter's desire not to be sustained in her present condition. The court also stated that where a close friend had been specifically designated by the patient to make medical decisions, or where there are close family members (and the court defined these as parents, spouse, siblings, or adult children), the appointment of a guardian is not necessary, and the family members or close friends so designated can be the surrogate decision-makers for the incompetent patient. In the nursing home situation, the Ombudsman must still be called in to determine that the elderly patient has left clear and convincing evidence of her desires and that, after securing two independent medical opinions which confirm the patient's medical condition, the medical alternatives, the risks involved, and the likely outcome if medical treatment is discontinued, the Ombudsman should defer to the decisions of the designated decision-maker. If there is no close family member, and no personal friend has been designated, a guardian should be appointed to deal with the Ombudsman on the nursing home's behalf.

Jobes also involved a nursing home patient in a persistent vegetative state, but not one over whom the Ombudsman would have jurisdiction. Mrs. Jobes's condition was caused by an anesthetic misadventure. Her husband and parents requested that a jejunostomy tube be removed. The nursing home refused, and the matter went to court.

There was some disagreement among the experts as to whether Mrs. Jobes was actually in a persistent vegetative state. The Supreme Court deferred to the trial court in determining which experts were more credible. Obviously, this is a problem if, as the court itself recommends, it is attempting to keep these cases out of the adversary judicial process. The bottom line is that if there is any disagreement as to the patient's condition, the matter probably will end up in court.

That having been said, the court made it clear that, where there is no reliable evidence of the patient's desires, deference will be given to close family members' substituted judgments. The court established the following procedures:

1. If there are, in the attending physician's good-faith opinion, close and caring family members who are willing to decide whether or not to refuse life-sustaining medical treatment for an irreversibly vegetative patient, there is no need for a guardian to be appointed.

2. If there are no close family members, and no surrogate decision maker has been designated by the patient (see *Peter* above), then an application must be made to the court for a guardian to be appointed.

3. In a hospital, the patient's condition must be confirmed by a Prognosis Committee; namely that the pa-

tient is in a persistent vegetative state and there is no reasonable possibility that the patient might recover to a cognitive, sapient state.

4. Once such confirmation is received, if the family/guardian and the attending physician concur that life support should be withdrawn (i.e., that the patient would want it withdrawn) it may be done without judicial review. In such circumstances the physician and the hospital will be immune from civil or criminal liability, if they acted in good faith and in accordance with these procedures.

5. In the nonhospital setting where there is no prognosis committee, the confirmation of two independent physicians, knowledgeable in neurology, along with the opinion of the attending physician, will substitute for the prognosis committee.

Finally, the court ruled that, under the circumstances of this case, the nursing home could not refuse to participate in the withdrawal of the j-tube. The main reason for this appears to be that the home gave no notice to the family of their ethical policies, and the refusal would frustrate Mrs. Jobes' right of self-termination. The importance of clearly establishing and notifying patients upon admission of any policies which would interfere with the free exercise of this right should be obvious. Subsequent petition for review by the United States Supreme Court in this case was denied. Mrs. Jobes died shortly thereafter. (Written by William P. Isele, a partner in the East Brunswick law firm, Gross & Novak, P.A., and an adjunct professor of health law at Seton Hall University School of Law.)

JURY TO DECIDE IF THREE PHYSICIANS ARE LIABLE FOR ONE ANOTHER'S MALPRACTICE

A jury should decide whether three physicians held themselves out to the public as a joint venture, so as to make them vicariously liable for one another's malpractice, a New York Appellate court ruled. A 36-year-old patient who had suffered from cerebral palsy since birth underwent an operation to have electrodes implanted in his brain to stimulate the cerebellar cortex. A second operation was performed a year later. After the second operation, hydrocephalus developed. As a result, the patient claimed he was permanently confined to a wheelchair and had lost vision of his left eye. He filed an action against the three physicians who were the senior physicians of the institute where the surgery was performed. Reversing a trial court's decision dismissing the complaint against the two physicians who did not perform the two operations, the appellate court said that it was a jury question as to whether the three physicians held themselves out to the public as a joint venture or physicians practicing jointly. If that were the case, then all three would be liable for the acts of the physician who performed the two operations. The patient served a summons and complaint only on the physician who performed the operations. If the patient were a patient of the entire medical group, then his timely service of a summons and complaint on the operating physician also constituted timely service on the other two physicians. The court said the two physicians should not have been dismissed from the case on their summary judgment motions. (*The Citation*, Vol. 55, No. 8, August 1, 1987)

A better alternative for hypertensives who are going bananas...

Spare your patients the extra cost—
in calories, sodium and dollars.

Spare your patients the rigors of
dietary K⁺ supplementation.

DYAZIDE[®]

25 mg Hydrochlorothiazide/50 mg Triamterene/SKF

Effective antihypertensive*
therapy...without
the bananas

DAW
'DYAZIDE' AS WRITTEN.

* Not for initial therapy. See brief summary.

Before prescribing, see complete
prescribing information in
SK&F CO. literature or PDR.
The following is a brief summary.

WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or

without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin[ACTH]). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak lolic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The

following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak™ unit-of-use bottles of 100.

INTRODUCTION

On June 1, 1986, the Board of Trustees of the Medical Society of New Jersey banned smoking in its headquarters for all employees, members, guests, and committee functions. The Board took this action due to the "overwhelming evidence against smoking, developing liability laws, state laws relating to the providing of a smoke-free environment in the workplace, and financial considerations." Such a policy was accepted without challenge, and, to this day, the building remains smoke-free.

The purpose of this special issue, "Treating Tobacco Dependence," is to share reflections on this problem with our readership. Developing a smoke-free society is a slow, lengthy process. We believe the information contained in this issue will help us all move toward this goal.

The following poem, written by Robert S. Vena, gets right to the heart and lung of the matter:

*After 40 years of smoking
I found the strength to stop
It started when I was 10 years old,
I stole them from my Pop.*

*I can hardly walk a city block
or blow out a lighted match
My lungs are just as black as coal,
My breath is hard to catch.*

*I thought it made me grown up
Like Bogey and Bacall,
I've shelled out many thousands
on 'Little Johnny's Call.'*

*Hoping that it's not too late
To help the very young
To replace their smoking habit
Before they misplace a lung.*

We would like to thank John Slade, MD, for his contributions to this special issue. Photographic credits are as follows: pages 102, 109, 116-117, 120, 131, 139-140, 143, 152-153, John Slade, MD; page 97, Jim Towns; page 121, Association for Nonsmokers—Minnesota; page 108, Andrew Hahn, MD; page 111, Sarah Schenck; page 119, American Cancer Society; and page 154, Arizonans Concerned About Smoking. We're putting lives back together

As a physician you've probably seen it. A family's struggle against alcohol or drugs. A man or woman afraid to ask for help in dealing with depression. A young girl hiding an eating disorder behind a smiling or popular personality.

At the Carrier Foundation, we work with physicians in treating troubled adolescents and adults. Unlike most general hospitals, all our resources are dedicated to this mission. And have been for more than seventy-five years.

Recognized by all major insurance companies, Carrier is a private, non-profit psychiatric hospital providing both inpatient and outpatient programs. Some of our specialized programs include: addiction recovery service, adolescent program, affective disorders program, behavioral therapy, eating disorders program, family therapy, geriatric program and women's program. For more information, call the Carrier Foundation at 1-800-223-0207. The Carrier Foundation. We're putting lives back together.

The Role of Health Professionals

JOHN SLADE, MD

Tobacco has been a source of personal discomfort and embarrassment for many of us. Frequently, we have cared for patients for many years only to lose them to a fatal illness caused by tobacco. At such times, we may recall unheeded advice to quit smoking, and we may even have asked ourselves whether there was anything else we could have done to help our patients stop smoking in time or even to not start in the first place. This profound frustration, in part, has grown out of a mistaken paradigm about tobacco and nicotine dependence. This special issue of *NEW JERSEY MEDICINE*, which entirely concerns tobacco, is an attempt to offer a more productive approach to the treatment and prevention of nicotine dependence than most of us were taught.

Medical training and practice for the last generation has emphasized the important research findings which demonstrated the myriad ways in which nicotine dependence produces morbidity and mortality. Circumspect jargon referring to tobacco as a "risk factor" for disease, however, has interfered with the development of an appreciation for nicotine dependence as a primary disorder which regularly

produces lung cancer, coronary artery disease, and chronic obstructive pulmonary disease as complications.¹ Since 1980, though, the American Psychiatric Association has classified nicotine dependence as a pathological process with remarkable similarities to other chemical dependencies. The current edition of the *Diagnostic and Statistical Manual* extends and amplifies this recognition of the underlying unity among the addictions.²

Medical school curricula have ignored the management of tobacco dependence even more steadfastly than they have failed to teach useful clinical approaches to alcoholism. A popular textbook of internal medicine tells its readers to advise patients who smoke to cut down if they cannot or will not follow advice to quit smoking.³ Such advice, in a chapter on alcoholism, would be quickly expunged because of the collusion involved in the physician sanctioning a chemical dependency. The contemporary definition of an addiction has important implications for management: A chemical dependency is the loss of control over the use of a substance plus continued use despite problems from that use.² Advice to cut down is an invitation to continue using. Any reduced level of consumption usually is not maintained for long, and the risk of harm to self or others is not avoided.

Nicotine dependence is responsible for more deaths than any other cause of preventable death.⁴ The benefits, then, from successful treatment and prevention are enormous. Thomas Kottke, a cardiologist at the University of Minnesota, points out that a 15 percent reduction in the prevalence of smoking prevents more deaths from myocardial infarction (MI) than does caring for acute MIs in coronary care units (CCU). We have not hesitated to pour enormous energy and resources into establishing and maintaining CCUs. The effort to control

John Slade, MD, is affiliated with the Department of Medicine, UMDNJ-Robert Wood Johnson Medical School. Requests for reprints should be sent to Dr. Slade, St. Peter's Medical Center, 254 Easton Avenue, New Brunswick, NJ 08903.

Representative _____
United States House of Representatives
Washington, D.C. 20515

Dear Representative:

I wish to inform you that one of your constituents, who was a patient of mine, has died. The death was due to the following disease:

- ☐ lung cancer.
- ☐ other tobacco-related cancer (includes mouth, larynx, esophagus cancer).
- ☐ chronic obstructive lung disease (includes emphysema).
- ☐ coronary heart disease.
- ☐ other tobacco-related vascular disease.

This person was a smoker or a smokeless tobacco user. Tobacco use is the major avoidable cause of this disease.

I urge you to co-sponsor and actively support legislation (such as H.R. 1272) that would prohibit the advertising and promotion of this uniquely harmful product. Please keep this person's tobacco-related death in mind as you consider this issue.

Sincerely,

Signed

Address

The Medical Society of New Jersey is supporting a postcard campaign to promote AMA-sponsored legislation which would ban tobacco product advertising and promotion. This approach, which personalizes mortalities from tobacco use for members of Congress, was first employed by the British Medical Association a few years ago. Supplies of the postcard are available from county medical societies in New Jersey.

nicotine dependence will not likely be so expensive, yet its benefits certainly will be greater. One approach taken by the Medical Society of New Jersey is supporting a postcard campaign to promote AMA-sponsored legislation which would ban tobacco product advertising and promotion (Figure).

THE SPECIAL ISSUE

This special issue grew out of a symposium presented at the Academy of Medicine of New Jersey in April 1987 sponsored by the Medical Society of New Jersey, the New Jersey State Department of Health, and the Academy, and cosponsored by the New Jersey chapters of the American Cancer Society, the American Heart Association, the American Lung Association, and the American Psychological Association. Its purpose was to provide the medical community with information and tools for the management of nicotine dependence. Nearly every member of the faculty from that symposium has contributed to this issue; in addition, this issue contains a timely report from the Health Department's Commission on Smoking or Health.

At the symposium, the Medical Society of New Jersey honored the singular contributions of two individuals to the control of nicotine dependence in New Jersey: Matt Martin was cited for his many years of leadership developing public health policies to control the tobacco disease epidemic in New Jersey, and Geraldine O. Delaney was honored for her accomplishment at Little Hill-Alina Lodge, New Jersey's first smoke-free health care facility.

A PREVIEW OF THE ISSUE

In his article on nicotine dependence, Jack Henningfield from the National Institute on Drug Abuse reviews the scientific basis for our understanding of nicotine dependence as a primary substance use disorder; much of the work in this area was conducted in his laboratory. Tracy Orleans shares a practical approach to the management of this disease based on a thorough understanding of the current research literature as well as on her years of experience as a clinician and researcher in a variety of outpatient and inpatient settings. Geraldine O. Delaney reports on her approach to the treatment of nicotine dependence simultaneously with the treatment of alcoholism at Little Hill-Alina Lodge. She reports that after prohibiting tobacco use there in March 1985, there was no reduction in applications to her program, and there is still a waiting list for admission. Elizabeth Wilson discusses the enormous contribution nursing can make to the treatment and prevention of nicotine dependence. Regina Carlson and Lawrence Meinert explore several aspects of clean air policies in the workplace. Ms. Carlson shares

insights gleaned from years of experience in helping businesses become smoke-free, and Dr. Meinert reviews the scientific evidence of harm from second-hand tobacco smoke. The article on smoke-free hospitals by Jeffrey Burtaine reviews the enormous progress which has been made in these key institutions over the past four years. Bonnie Vierthaler, founder of the Badvertising Institute, writes about her satiric series of collages, "The Joy of Smoking." In addition to the school exhibits for which she created the show, "The Joy of Smoking" has been enthusiastically received at three national medical meetings and was featured at the symposium in Lawrenceville last April. The final contribution to this special issue may be the most important one. The Commission on Smoking or Health, with Dr. Reichman as Chairman, issued a report in November on children and tobacco; the recommendations are a blueprint for preventing nicotine dependence in today's young people. This report has been endorsed by the Board of Trustees of the Medical Society of New Jersey.

CONCLUSION

Nicotine dependence is a huge problem, but it can be a manageable one. Health professionals need not be overwhelmed and made to feel powerless by *Nicotiana tabacum*. As with other complex problems in medicine, this one has many component parts, and each one, by itself, is tractable in its own way. We need to analyze these smaller problems with care and adopt appropriate tools for solving each of them. Finally, we need to recognize and create opportunities to use these tools. In this manner, health professionals have made enormous strides against numerous other diseases. There is great opportunity here: nicotine dependence is both treatable and preventable, and the needed tools are at hand. This special issue will serve its purpose if it stimulates thinking, learning, and action against nicotine dependence, the most prevalent deadly disease the nation faces today. ■

ANNOUNCING

NEW

KEFTAB™

cephalexin hydrochloride monohydrate

Dista Products Company
Division of Eli Lilly and Company
Indianapolis, Indiana 46285
Mfd by Eli Lilly Industries, Inc
Carolina, Puerto Rico 00630

© 1987, DISTA PRODUCTS COMPANY KC-9008-B-849338

Computer-generated molecular
structure of cephalexin
hydrochloride monohydrate

Convenient 500-mg b.i.d. dosage and demonstrated effectiveness for treatment of:

skin and skin structure infections*
uncomplicated cystitis†
pharyngitis†

new hydrochloride salt form of cephalexin—
requires no conversion in the stomach before
absorption

well-tolerated therapy

may be taken without regard to meals

for other indicated infections, 250-mg tablets available
at b.i.d. dosage

is less than Keflex® (cephalexin)

is contraindicated in patients with known allergy to the
cephalosporins and should be given cautiously to penicillin-
sensitive patients.

is the drug of choice in the treatment and prevention
of streptococcal infections, including the prophylaxis
of rheumatic fever.

*Susceptible strains of *Staphylococcus aureus* and/or β -hemolytic streptococci.
†Susceptible strains of *Escherichia coli*, *Proteus mirabilis*, and *Klebsiella* sp.
‡Susceptible strains of group A β -hemolytic streptococci.

KEFTAB™ (cephalexin hydrochloride monohydrate)

Summary: Consult the package literature for prescribing information.

Indications and Usage:

Respiratory tract infections caused by susceptible strains of *Streptococcus pneumoniae* and group A β -hemolytic streptococci.

Skin and skin structure infections caused by susceptible strains of *Staphylococcus aureus* and/or β -hemolytic streptococci.

Bone infections caused by susceptible strains of *S aureus* and/or *Proteus mirabilis*.

Genitourinary tract infections, including acute prostatitis, caused by susceptible strains of *Escherichia coli*, *P mirabilis*, and *Klebsiella* sp.

Contraindication: Known allergy to cephalosporins.

Warnings: KEFTAB SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Keftab in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Keftab should be administered cautiously in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy and lactation. Cephalexin is excreted in mother's milk. Exercise caution in prescribing Keftab for these patients.
- Safety and effectiveness in children have not been established.

Adverse Reactions:

- *Gastrointestinal*, including diarrhea and, rarely, nausea and vomiting. Transient hepatitis and cholestatic jaundice have been reported rarely.
- *Hypersensitivity* in the form of rash, urticaria, angioedema, and, rarely, erythema multiforme, Stevens-Johnson syndrome, or toxic epidermal necrolysis.
- *Anaphylaxis* has been reported.
- *Other reactions* have included genital/anal pruritus, genital moniliasis, vaginitis/vaginal discharge, dizziness, fatigue, headache, eosinophilia, neutropenia, and thrombocytopenia; reversible interstitial nephritis has been reported rarely.
- Cephalosporins have been implicated in triggering seizures, particularly in patients with renal impairment.
- *Abnormalities in laboratory test results* included slight elevations in aspartate aminotransferase (AST, SGOT) and alanine aminotransferase (ALT, SGPT). False-positive reactions for glucose in the urine may occur with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (Glucose Enzymatic Test Strip, USP, Lilly).

Learning To Fight *Nicotiana tabacum*

JOHN SLADE, MD

The tobacco epidemic is an especially difficult medical problem. Although progress is being made in this country, tobacco remains the leading cause of preventable death, accounting for between 350,000 and 500,000 deaths per year.¹⁻³ Furthermore, cigarette use is expanding in the world

as a whole: since 1960, cigarette consumption has doubled, to 5 trillion units per annum.⁴ In 1987, every 48 minutes, another New Jersey citizen dies because of cigarettes.

BLOCKS TO TREATMENT AND PREVENTION

How did this problem come to be so enormous, and why has this devastating epidemic been so dif-

John Slade, MD, is the Guest Editor of this issue.

ficult to control? At least six interrelated elements have contributed to prolonging this seemingly intractable epidemic:

1. Nicotine is a drug of dependence.⁵⁻⁷ It produces an addiction which usually begins in childhood and is self-perpetuating unless deliberate; sometimes enormous individual effort is expended to develop a program of lasting abstinence. Elaborate defense mechanisms, including denial, rationalization, and enabling, develop around tobacco use once a person loses control of his consumption. The American blend cigarette, introduced in 1913, is the most addictive form of tobacco yet invented.

2. Tobacco was a major part of the economy for three centuries before evidence of harm from its use became conclusive, just over a generation ago. Tobacco helped finance the American Revolution. Its past importance is symbolized by the use of tobacco leaves and flowers as decorations atop columns dating from 1818 in the Old Senate Rotunda of the United States Capitol. Its current importance is suggested by the decorations in the Treaty Rooms at the U.S. State Department, completed in 1986, which employ the same motif.⁸

3. The prevailing social attitudes towards tobacco have been remarkably casual and permissive for several generations. While such attitudes are changing, there remains an incredible, banal ordinariness about the display and sale of tobacco products and their use in public. Most cigarettes (52.5 percent) are sold in grocery stores and supermarkets.⁹ Cigarettes have not always enjoyed this almost indifferent acceptance. Rather, it developed in parallel with the profound increase in cigarette consumption during the present century. In 1911, an editorial writer noted, "Anything that may be done to restrict the general and indiscriminate use of tobacco in public places, hotels, restaurants, railroad cars, will receive the approval of everybody whose approval is worth having."¹⁰

4. Tobacco merchants have continued the aggressive promotion of their products and even expanded into new markets with an astounding indifference to the illness and death which results from the use of their merchandise.¹¹⁻¹⁴ About six cents per pack, \$2 billion each year, is spent marketing cigarettes in this country; about \$50 million of that is spent in New Jersey. The industry continues to insist that tobacco has not been shown to cause harm, and that its use is voluntary.^{15,16} Paradoxically, although these businesses strenuously object to assertions that cigarettes cause any harm, tobacco companies are using federal laws which require mildly worded, inconspicuous warning labels as shields from tobacco product liability. This industry should have voluntarily issued prominent, explicit warnings and avoided promotion of its product or expansion

into new markets as soon as substantial evidence of harm had accumulated until the situation could be clarified.^{17,18}

5. The culture at large has grown adept at overlooking the harm caused by tobacco. When chemical dependence is discussed, tobacco is not on the agenda. For instance, although the Media-Advertising Partnership for a Drug-Free America is presenting the largest public service campaign in the history of American advertising, it is ignoring the leading cause of death from drugs. In 1985, the Drug Enforcement Administration and the National Organization for the Reform of Marijuana Laws estimated U.S. marijuana consumption at around 18,000 metric tons. The 1984 production level for flue-cured tobacco was 375,000 metric tons, and an estimated 312,000 metric tons of Burley tobacco were grown. Thus, the marijuana market is only about 3 percent the size of the tobacco market. Since most states have age of sale laws for tobacco, it is likely that more tobacco than marijuana is sold illegally to those under age 18. Furthermore, tobacco use is one of the important pathways to marijuana use among adolescents.¹⁹ Several observers have noticed the scant attention accorded tobacco in general interest magazines, especially those which carry cigarette advertising.^{12,14,20}

6. Health professionals have been minimally involved in attending to this problem. Even simple, perfunctory advice to patients about tobacco use often is omitted by physicians.²¹ At the public policy level, there are only a handful of small offices in state health departments responsible for tobacco prevention programs, and the national program, the Office on Smoking and Health, is a tiny operation.

TOBACCO USE IN CHILDHOOD

Most tobacco use begins in childhood, and the younger a person is when he first smokes, the more likely he is to become addicted.^{22,23} While a debate rages over whether advertising influences young smokers, it is clear that children metabolize cigarette advertising quite thoroughly, and that the most popular brands among children are those whose ads are most readily recognized by the young.^{24,25} Part of the reason that there are no definitive data regarding marketing influences on those the industry might call "replacement smokers" is that there is no unexposed control group for such a study. I am persuaded that marketing is a critical factor in childhood onset tobacco use.^{11,12}

At the same time they are making critical decisions about experimentation with tobacco, people have distorted beliefs about the subject.²⁶ Teenagers believe that smoking is far more prevalent than it is. Those who smoke or who intend to smoke are more likely than confirmed nonsmokers to believe

that smoking is or would be less harmful to themselves than to other people. The decision to experiment with tobacco cannot be accurately described as an informed choice.

Table 1. Where Do You Get Your Cigarettes? (ages 12-18)

Source	N	%
Friends	52	11.0
Relatives	29	6.1
Buy Them	423	89.6
Other	7	1.5
Total Respondents	472	—

David B. Lambert, Chilton Research Service, personal communication, March 25, 1987.

The greatest period of experimentation with tobacco occurs in an age group to which it is illegal in most states for merchants to sell tobacco products,²⁷ yet it is easy for an underage person to purchase cigarettes, either over the counter or via vending machines.

The Tobacco Institute does not believe that underage retail sales are a big problem. An Institute spokesman commented, "Only 10.4 percent of teenage smokers purchase their own cigarettes."²⁸ The Institute buttresses this surprising statistic with a reference to a respected survey of teenagers and smoking.²⁹ The reference does not contain the cited data, however. The Chilton Research Service found the data (Table 1):³⁰ only 10.4 percent of teenage smokers in this survey do not usually buy their own cigarettes.

The cigarette market among those under age 18 is worth about a half billion dollars per year. An estimate of this market, adapted from work by Joe Tye is presented in Table 2. The smokeless tobacco market in this population is worth an additional \$130 million according to Tye's estimate. Although the tobacco industry claims to not want anyone to smoke before age 21, it sells about \$1.3 billion worth of merchandise to this age group each year.³¹

Since cigarette sales yield a profit of more than 25 percent of revenues, and roughly half of the retail price of cigarettes is received as revenue by the manufacturer, these figures suggest that \$163 million in annual profit as well as virtually the entire future supply of adult smokers are derived from sales the industry claims to not want. If the unwanted profits from these sales were recovered by the states, the Department of Health in New Jersey would have nearly \$4 to \$5 million per year available to mount a program to prevent sales to teenagers. Even so, this budget would be quite modest in comparison to the money devoted to marketing cigarettes in the state.

Based on Table 2, New Jersey smokers under age 18 pay about \$3 million in cigarette excise taxes to New Jersey annually, but this revenue provides no services for the treatment or prevention of nicotine dependence among the young. Another estimate of cigarette consumption in this age group suggests that this group pays more than \$7 million in state excise taxes.³² The actual value is likely between the two figures.

AN INDUSTRY RESPONDS TO CONCERNS

The cigarette industry repeatedly has taken steps to allay public fears about its products and to accommodate, up to a point, problems created by tobacco products. Several examples will illustrate the characteristically cynical approach these companies have taken.

In the early 1950s, new brands of filter cigarettes were introduced as the public became concerned about the evidence that cigarettes caused lung cancer. The P. Lorillard Company first marketed Kent cigarettes in 1952. Advertisements promised "the greatest health protection ever developed."³³ First suspected by Blum,³⁴ it now is clear that the Micronite filter in Kent cigarettes delivered this "health protection" by its filtering agent: asbestos.

A Kent advertisement boasted that its filter proved the most efficient in a test conducted by the American Medical Association³⁵ that compared three brands; the most effective filter was the one composed of asbestos and paper.³⁶ One article identified the form of asbestos in Kent as crocidolite.³⁷ At least one case of asbestosis in a worker exposed at the Lorillard filter factory has been reported.³⁸ It is unclear how long asbestos continued to be used in the Micronite filter, but by the early 1950s asbestos manufacturers knew it to be harmful.³⁹

An international tobacco industry conference and exhibition was held in Richmond, Virginia in September 1986; exhibitors for flavoring companies discussed a number of important changes in cigarette additives in recent years. While there presently are no regulations which restrict what can be included in a commercial tobacco blend, there has been some effort to require that a list of ingredients be shared with government officials. Perhaps in anticipation of such rules or against the possibility of even more stringent controls or widespread disclosures, the cigarette manufacturers have re-examined all of the additives used to insure that they are "food quality"; that is, that they are considered safe for addition to food products. This has meant that such traditional additives as deer tongue leaves have been eliminated from tobacco blends because the ingredient which gives the vanilla-like flavor to this herb is coumarin.

In addition, a panel of toxicology consultants supervises the testing of potential additives to insure

that such ingredients do not produce harmful substances when burned. The experimental work involved in such tests frequently is performed by laboratories in other countries; the result, if unfavorable, might be difficult to discover in United States legal proceedings. It is likely that tobacco itself would not pass the testing panel's standards for additives.

In a cigarette factory, conveyer belts move vast quantities of tobacco around from place to place. Such belts may become frayed, so bits of belting can be incorporated into the tobacco blend. Because manufacturers are concerned lest any toxic gases or particulates arise from the combustion of bits of conveyer belting, all such belts now are made of materials which produce nontoxic fumes when burned. The same standard has not been applied to the main ingredient.

The new generation cigarette-making machines is capable of producing 8,000 cigarettes per minute (cpm). These \$660,000 devices replace machines which churned out 4,500 cpm. A machine manufacturer salesman indicated that Philip Morris had asked his company to design a cigarette maker capable of operating at 14,000 cpm. This continued push for improvements in technical wizardry from an industry whose domestic sales are steadily declining seems puzzling, except for the fact that cigarettes are a growth market in most of the world because of continual, aggressive marketing by these same companies.^{4,12,13}

WHAT CAN THE PHYSICIAN DO?

What can be done in this grim circumstance? There are many opportunities to make a positive impact on this situation. Here are suggestions which physicians can work for at the public policy level, and suggestions which can be adopted in clinical practice.

Public Policy: Government must accord tobacco the attention it deserves. In each state, an Office for the Treatment and Prevention of Nicotine Dependence should be established and supported. Without support from concerned health professionals and citizens, this proposal will not flourish because of the perceived political risks involved. Such an office, funded by the cigarette excise tax, already is a reality in Minnesota.

Second, children must be protected. The report of the Commission on Smoking or Health in this issue addresses many of the measures needed to accomplish this. The report of the Commission on Smoking or Health appears on page 151. Private initiatives are needed as part of this effort. The California Medical Association has appropriated \$50,000 to address the problem of children and tobacco.

Third, places where medical care is given must be free of tobacco. There are two major challenges here: smoke-free hospitals and tobacco-free pharmacies. The Medical Society of New Jersey has called for legislation to ban smoking from all acute-care hospitals, and hospitals are moving voluntarily in this direction. Pharmacies undermine their role as health care providers if they also sell tobacco products.^{40,41} Tobacco-free pharmacies can be found in most counties of the state; more pharmacies should be encouraged to join their ranks.

Clinical Practice: Physicians should regard nicotine dependence as an illness in and of itself, instead of a mere risk factor for disease. Physicians should learn how best to help their nicotine-dependent patients become abstinent from tobacco. The most important elements (forging a therapeutic alliance, taking a history, educating the patient, developing a specific treatment plan, planning follow-up, and referring when appropriate) are identical in form to the way hundreds of other diseases are managed. To date, though, medical education usually

Table 2. Estimated Cigarette Sales to People 21 Years of Age or Younger

Age Group	Population (Millions)	% In School	Smoking Among Those in School (%)	Total Smokers (millions)	Packs Per Week	Annual Sales at \$1.25/pack (millions)
10-13	13.0	98	5	0.65	1	42.3
14-15	7.4	95	15	1.17	2	152.1
16-17	7.2	85	18	1.49	3	290.6
18	3.7	80	20	0.89	4	231.4
Total	31.3			4.20		\$716.4*

Adapted from analysis by Joe Tye. Population data: U.S. Vital Statistics, 1986. Smoking rates: extrapolated from Johnston LD, O'Malley PM, Bachman JG: Drug use among American high school students, college students, and other young adults, National Institute on Drug Abuse, 1986. Dropout rate estimated. Smoking assumed to be twice as prevalent among dropouts.

*Sales to those under 18 are \$485 million. About 7.9 million people are in the age group 19-20. If 30 percent of these people smoke an average of 4 packs per week, this group spends \$616.2 million per year on cigarettes. The total sales of cigarettes to those under 21 is on the order of \$1.3 billion.

has not provided instruction or exemplars of this approach to treating nicotine dependence. Physicians should be alert to protect nonsmokers from tobacco smoke, not only by encouraging clean-air policies in public places, but also by supporting clean-air initiatives in the homes of nonsmoking patients. This especially is important for children. In a related matter, nonsmokers should be encouraged not to enable the nicotine dependence of those around them by such activities as cleaning out

ashtrays or purchasing tobacco products.

SUMMARY

Tobacco is responsible for the largest epidemic of the 20th century. The tobacco industry devotes enormous time, intellectual energy, and money to maintaining tobacco's place in the culture. Unless the medical community mounts a focused and intentional campaign to control tobacco, this scourge will continue to devastate our patients. ■

Side Effects of Nicotine Dependence

JACK E. HENNINGFIELD, PhD

Most of the over 50 million Americans who smoke cigarettes know that they are exposing themselves to toxins that can lead to cancer and other diseases. The majority of these people would like to quit, and most try, repeatedly.¹ Data from the U.S. Public Health Service show that nearly 20 percent of those who try to quit smoking may succeed on their first attempt, and, by their seventh attempt, nearly 40 percent will have quit—and that is the good news. The bad news is that more than 60 percent will have been unsuccessful.² Clearly, to expose oneself on a daily basis to a known toxin

is not a simple, voluntary behavior of free will and pleasure. Of course, some people are able to quit, with seemingly little difficulty; these are the fortunate. For the rest, successful long-term abstinence from tobacco products at least may be a brief struggle; for others it will be a life-long trial, and for some it may be an impossible task.

Tobacco-related carcinogen exposure is a side effect of nicotine dependence. Why is there such clock-like, day-in/day-out, self-exposure to a source of cancer known to nearly all who smoke? Why is it that many who have quit have recurrent cravings for what they had considered to provide an important source of pleasure? Is there any physical basis to the claims of some who feel they are not as effective at work or as effective at coping with stress since they have given up tobacco? These sequelae, and others, of quitting are not simple responses to a change in habit. They are part of the addictive pro-

Guatemala 1987

cess that the U.S. Public Health Service, the Surgeon General, the American Psychiatric Association, and many others believe underlies the compulsive use of smoked and smokeless tobacco products.^{3,4}

The nicotine dependence process is a major impediment to the reduction of cancer and other tobacco-caused diseases. Reducing the exposure to many carcinogens is achieved simply by removing them from the workplace, using protective clothing, and filtering air and water. However, reducing the exposure to tobacco-borne carcinogens can be much more difficult since it usually occurs as a side-effect of nicotine dependence—and nicotine dependence can be powerful, as attested to by the heroin addicts who can give up narcotics but not tobacco.⁵ Recent studies have confirmed that, mg for mg, nicotine is more potent than cocaine in modifying behavior; it is as powerful and more potent than most barbiturates in causing physiologic effects that can be fatal; tolerance to behavioral and physiologic responses is as pronounced as that which occurs with the heroin-like narcotics. Whereas initial use can be intoxicating, subsequent higher levels of use are not associated with clear behavioral disruption. These findings are scientific proof of what has been suspected for many years—that nicotine is an addicting drug. Nicotine is not an innocuous ancillary constituent of tobacco. Nicotine is the single most critical element of the interface between tobacco carcinogens and cancer. Without nicotine, there is no evidence that there would be widespread com-

pulsive use of the most important preventable cause of death and disease. Unlike the flourishing market of decaffeinated beverages, of sugarless sweeteners, and of low-salt foods, denicotinized tobacco products have never sustained interest or provided continuing profit in the marketplace.

Nicotine dependence even limits efforts to simply reduce carcinogen exposure. The control levied by nicotine is so powerful that attempts by health-minded persons to reduce their risk of tobacco-related disease by reducing the number of cigarettes they smoke, or by switching brands, are thwarted by their need to maintain a minimal nicotine intake.^{6,7} This results from the processes of physical and behavioral dependence. These processes interact with the powerful, behavior-controlling features of nicotine that sustain the compulsive self-administration of a toxic substance.

The rest of this paper will describe some of the recent data regarding the mechanisms by which nicotine enables tobacco to take control over the behavior of those exposed. As should become evident, our understanding of such findings give cause for renewed hope for reducing exposure to tobacco-borne toxins.

A BEHAVIORALLY ADDICTING DRUG

That occasional use of tobacco could lead to compulsive, regular use has been known for centuries, as reported in various historical accounts.⁸

As described in basic pharmacologic textbooks, it

has been known for decades that the nicotine delivered when tobacco products are used is a potent and powerful drug which can control behavior and modify physiologic functioning.⁹ In 1942, Dr. L.M. Johnston suggested that "smoking tobacco is essentially a means of administering nicotine, just as smoking opium is a means of administering morphine."¹⁰ He had found that intravenous injections of nicotine could mimic many of the behaviorally important changes in mood and feeling produced by inhalation of tobacco smoke. More recently, Johnston's observations have been replicated and extended, leading to the conclusion that the role of nicotine in the tobacco dependence process is equivalent to the roles of drugs such as morphine, cocaine, and ethanol, in the dependencies to opium products, coca derivatives, and alcoholic beverages, respectively. Tests of nicotine have been conducted using the same procedures developed to evaluate the opioid narcotics (morphine and heroin), psychomotor stimulants (amphetamines and cocaine), and sedatives (barbiturates and alcohol). Even though, by definition, every drug is unique, testing drugs for their ability to addict users is a process of identifying critical common features, i.e. establishing pharmacologic equivalence. Nicotine has proved positive on all critical elements of these tests, as shown below:

Nicotine is a psychoactive drug. Analogous tests in both animals and humans have confirmed that nicotine has direct effects in the central nervous system that can lead to controlled behavior. The effects are dose-related and can be blocked by centrally acting nicotinic blockers, e.g. mecamylamine. Central nicotinic receptors, as well as changes in regional brain glucose utilization, appear important in the mediation of these effects.^{12,13}

Nicotine can alter mood and feeling state. Standardized tests have been used to confirm that nicotine can produce desirable elevations in mood state as can other addictive drugs under comparable conditions. These effects include dose-related increases in ratings of drug liking scores; they are sometimes termed "euphoriant" effects.¹¹ Nicotine also can alleviate certain undesirable states such as anxiety and boredom;¹⁴ such "useful" effects can enhance the strength of the addiction.

Nicotine can modify (condition) behavior. Analogous tests in both animals and humans have confirmed that nicotine can serve as a positive reinforcer (reward) which conditions behavior and thereby results in repetition of the behaviors which lead to the administration of the drug.¹⁵ Nicotine, in the tobacco vehicle, appears to provide an ideal source of drug reinforcement and its efficacy is increased by a range of conditions including anxiety, stress, and hunger.¹⁶

The results of studies using these strategies con-

firm that nicotine is a drug that shares critical features with other dependence-producing drugs. It has noteworthy multiple and malleable properties to serve as stimuli, to produce desirable changes in mood and feeling state, and to serve as reinforcers when the dose is "just right" (easily attainable by the so-called "finger-tip" dose control over the cigarette), and even to restrain behavior by aversive higher dose effects. These various effects of nicotine allow it to shape, steer, prod, and pull the behavior of the user down the path of dependence. It also is important to understand that these effects of nicotine are real and physically based. The behavior-controlling actions of nicotine are due to specific effects of nicotine on receptors and transmitters in the central nervous system and to the regulation of hormonal function; the effects of nicotine are dose dependent; they show orderly patterns that follow a regular course of onset and offset (pharmacodynamics); and the effects are related in a complex but orderly fashion to blood nicotine levels (pharmacokinetics). Of course, nicotine dependence is even more than this: chronic exposure of hormonal systems and tissue of the central nervous system results in adaptation to the pressure of nicotine and to physiologic dependence.

A PHYSIOLOGICALLY ADDICTING DRUG

Drugs can be addictive to their users whether or not they cause physical dependence, but when their characteristics are such that they readily take control over behavior and cause physical dependence, the resulting addiction can be highly pernicious. Nicotine does both. Physiologic or physical dependence generally is thought to result when tolerance (diminished responsiveness) develops to repeated drug use. Behavioral and physiologic functions then adapt to the presence of the drug and may be disrupted if the drug is abruptly removed. Just as there are standard tests to evaluate whether or not drugs cause behavioral dependence, there also are standardized methods to evaluate whether tolerance and physical dependence occur when a drug is repeatedly given.

Tolerance. Tolerance to nicotine has been studied using a variety of measures of behavioral and physiologic functioning over the decades.¹⁷ A survey conducted at the Johns Hopkins University School of Medicine confirmed one likely consequence of such tolerance development. That study showed that the course of development of tobacco dependence follows an orderly pattern of daily dose graduation in which most people begin at a level of only a few cigarettes per day.¹⁸ These findings are consistent with those which showed that adolescents actually obtain more nicotine per cigarette as they grow older and presumably have smoked longer.¹⁹

Rotterdam 1986

Physical dependence. Confirmation that physical dependence was produced by nicotine has been obtained in a series of studies by Drs. Hughes and Hatsukami. In an elegant series of studies, these researchers have studied the physiologic dependence that can develop when nicotine is taken in the form of cigarette smoke, smokeless tobacco, and nicotine polacrilex (chewing gum).²⁰ Two of the main findings were: an orderly syndrome of physiologic and subjective responses follows abrupt termination of nicotine administration, and withdrawal from nicotine is qualitatively similar, regardless of the vehicle employed. Studies by other researchers have obtained many of these same kinds of findings and also have shown that the severity of the tobacco withdrawal syndrome is related directly to the dose of nicotine to which the person had been taking. A series of studies conducted at the Addiction Research Center has verified the following additional findings: withdrawal includes objectively measured deficits in ability to perform tasks such as logical decision making and arithmetic; the onset of withdrawal-associated changes in electroencephalogram (EEG) activity; and deficits in performance occur within hours of the last cigarette and may persist for at least ten days (the duration of observation during abstinence in this study).¹⁸ Therefore, it is not clear how long physiologic withdrawal lasts.

Treatment of tobacco withdrawal with nic-

otine. The observation that an alternate nicotine delivering formulation can at least partially substitute for tobacco opened the door to the use of nicotine in a therapeutic modality, much as benzodiazepines can be used to help manage alcohol withdrawal, and methadone can be used to manage heroin addiction. At present, the only commercially available formulation for the treatment of tobacco dependence is the nicotine polacrilex (chewing gum).^{22,23} Studies at the Addiction Research Center showed that use of nicotine gum could block the withdrawal-associated behavioral performance deficits, EEG changes, and most other signs and symptoms.¹⁸ The effect of the gum was especially impressive since the volunteers did not actually "like" the gum. The withdrawal-related measure that was not affected by nicotine was "desire to smoke." This finding is analogous to that found in other forms of drug dependence when replacement therapy is used. It is compatible with the notion that "desire" is a behavioral response that is only partly determined by pharmacologic state. Therefore, the main therapeutic action of nicotine gum would seem to be in the alleviation of physically based signs and symptoms of withdrawal, but not necessarily in blocking the desire to smoke.

Work by many investigators has confirmed that nicotine replacement is a useful adjunct when used with effective therapies in treating tobacco dependence. In fact, nicotine gum not only meets the criteria of therapeutic efficacy and low toxicity, but it also seems to have a relatively low potential for abuse. Thus, it is easier for most people eventually to quit using the nicotine gum than to quit using tobacco.

CONCLUSIONS

It now is overwhelmingly clear that tobacco-delivered nicotine has a substantial role, albeit indirect, in the cause of cancer and other tobacco-associated diseases. Cancer and other diseases can be caused by repeated exposure to certain toxins: the nicotine dependence process insures that such exposure will be frequent and chronic for many people, and that their attempts to eliminate, or even to reduce, such exposure may be thwarted by their dependence upon nicotine. But nicotine itself also may be used therapeutically to reduce such toxic exposure, since it is the tobacco vehicle which is the primary source of tobacco-related carcinogens. Thus, if the nicotine vehicle or formulation is changed to a nontoxic one, the health hazard can be substantially reduced.²²

The fact that certain elements of withdrawal or emergent symptoms, e.g. anxiety or weight gain, may persist indefinitely in some people suggests that these persons are at life-long risk for resumption of high-level carcinogen exposure. For these persons,

extended or possibly even life-long access to nicotine replacement may be necessary. Fortunately, there is little evidence that the currently available nicotine gum formulation is likely to be used by those not initially dependent upon tobacco-delivered nicotine. Therefore, it would seem that a substantial reduction in the overall level of health risk to our population may be accomplished by the adjunctive utilization of nicotine replacement.^{22,24} In addition, it should be useful to develop new nicotine replacement formulations for those who cannot use nicotine-delivering gum. This could constitute a major additional step in the elimination of tobacco dependence, and subsequently, nicotine dependence in those for whom the tobacco-to-therapeutic formulation transfer was accomplished. It could be an equally great contribution in reducing the exposure

to known carcinogens.

A caveat in the pharmacologic treatment of tobacco dependence is that development of alternative replacement approaches should be constrained by abuse liability testing to prevent formulations from being marketed which could result in new forms of nicotine abuse that were not initiated by tobacco use.²⁶ There is no evidence that the gum formulation is attractive to nontobacco users. However, it would seem possible to produce nontobacco nicotine-delivering formulations that are as addictive as the tobacco versions. It also appears that the potentially valuable oversight of the Food and Drug Administration might be avoided by marketing new nicotine-delivering formulations that may be addictive as well as causing cancer by their containing a small percentage of tobacco. ■

The World's Most Popular K*

Slow-K[®]
potassium chloride
slow-release tablets
8 mEq (600 mg)

It means "dependability" in almost any language

*Based on worldwide sales data on file, CIBA Pharmaceutical Company.
Capsule or tablet slow-release potassium chloride preparations should be reserved for patients who cannot tolerate, refuse to take, or have compliance problems with liquid or effervescent potassium preparations because of reports of intestinal and gastric ulceration and bleeding with slow-release KCl preparations.

Before prescribing, please consult Brief Prescribing Information on next page.

C I B A

The World's Most Popular K

For good reasons

- **It works**—a 12-year record of efficacy¹
- **It's safe**—unsurpassed by any other KCl tablet or capsule^{2*}
- **It's acceptable vs liquids**—greater palatability, fewer GI complaints, lower incidence of nausea²
- **It's comparable to 10 mEq**—in low-dosage supplementation^{3†}
- **It's economical**—less expensive than all other leading KCl slow-release supplements on a per tablet cost to the patient¹

Slow-K®
potassium chloride
slow-release tablets 8 mEq (600 mg)

For patients who can't or won't tolerate liquid KCl.

*The most common adverse reactions to potassium salts are gastrointestinal side effects.

†Pooled mean serum potassium following oral administration of 30 mEq K-Tab compared to 24 mEq Slow-K in diuretic-treated hypertensives (n = 20) over 8 weeks.

potassium chloride USP
Slow-Release Tablets
8 mEq (600 mg)

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE INSERT)

INDICATIONS AND USAGE

BECAUSE OF REPORTS OF INTESTINAL AND GASTRIC ULCERATION AND BLEEDING WITH SLOW-RELEASE POTASSIUM CHLORIDE PREPARATIONS, THESE DRUGS SHOULD BE RESERVED FOR THOSE PATIENTS WHO CANNOT TOLERATE OR REFUSE TO TAKE LIQUID OR EFFERVESCENT POTASSIUM PREPARATIONS OR FOR PATIENTS IN WHOM THERE IS A PROBLEM OF COMPLIANCE WITH THESE PREPARATIONS.

1. For therapeutic use in patients with hypokalemia with or without metabolic alkalosis; in digitalis intoxication and in patients with hypokalemic familial periodic paralysis.
2. For prevention of potassium depletion when the dietary intake of potassium is inadequate in the following conditions: patients receiving digitalis and diuretics for congestive heart failure; hepatic cirrhosis with ascites; states of aldosterone excess with normal renal function; potassium-losing nephropathy; and certain diarrheal states.

3. The use of potassium salts in patients receiving diuretics for uncomplicated essential hypertension is often unnecessary when such patients have a normal dietary pattern. Serum potassium should be checked periodically, however, and if hypokalemia occurs, dietary supplementation with potassium-containing foods may be adequate to control milder cases. In more severe cases supplementation with potassium salts may be indicated.

CONTRAINDICATIONS

Potassium supplements are contraindicated in patients with hyperkalemia, since a further increase in serum potassium concentration in such patients can produce cardiac arrest. Hyperkalemia may complicate any of the following conditions: chronic renal failure, systemic acidosis such as diabetic acidosis, acute dehydration, extensive tissue breakdown as in severe burns, adrenal insufficiency, or the administration of a potassium-sparing diuretic (e.g., spironolactone, triamterene) (see OVERDOSAGE).

All solid dosage forms of potassium supplements are contraindicated in any patient in whom there is cause for arrest or delay in tablet passage through the gastrointestinal tract. In these instances, potassium supplementation should be with a liquid preparation. Wax-matrix potassium chloride preparations have produced esophageal ulceration in certain cardiac patients with esophageal compression due to an enlarged left atrium.

WARNINGS

Hyperkalemia (See OVERDOSAGE).

In patients with impaired mechanisms for excreting potassium, the administration of potassium salts can produce hyperkalemia and cardiac arrest. This occurs most commonly in patients given potassium by the intravenous route but may also occur in patients given potassium orally. Potentially fatal hyperkalemia can develop rapidly and be asymptomatic.

The use of potassium salts in patients with chronic renal disease, or any other condition which impairs potassium excretion, requires particularly careful monitoring of the serum potassium concentration and appropriate dosage adjustment.

Interaction With Potassium-Sparing Diuretics

Hypokalemia should not be treated by the concomitant administration of potassium salts and a potassium-sparing diuretic (e.g., spironolactone or triamterene), since the simultaneous administration of these agents can produce severe hyperkalemia.

Gastrointestinal Lesions

Potassium chloride tablets have produced stenotic and/or ulcerative lesions of the small bowel and deaths. These lesions are caused by a high localized concentration of potassium ion in the region of a rapidly dissolving tablet, which injures the bowel wall and thereby produces obstruction, hemorrhage, or perforation. Slow-K is a wax-matrix tablet formulated to provide a controlled rate of release of potassium chloride and thus to minimize the possibility of a high local concentration of potassium ion near the bowel wall. While the reported frequency of small-bowel lesions is much less with wax-matrix tablets (less than one per 100,000 patient-years) than with enteric-coated potassium chloride tablets (40-50 per 100,000 patient-years) cases associated with wax-matrix tablets have been reported both in foreign countries and in the United States. In addition, perhaps because the wax-matrix preparations are not enteric-coated and release potassium in the stomach, there have been reports of upper gastrointestinal bleeding associated with these products. The total number of gastrointestinal lesions remains approximately one per 100,000 patient-years. Slow-K should be discontinued immediately and the possibility of bowel obstruction or perforation considered if severe vomiting, abdominal pain, distention, or gastrointestinal bleeding occurs.

Metabolic Acidosis

Hypokalemia in patients with metabolic acidosis should be treated with an alkalinizing potassium salt such as potassium bicarbonate, potassium citrate, or potassium acetate.

PRECAUTIONS

General:

The diagnosis of potassium depletion is ordinarily made by demonstrating hypokalemia in a patient with a clinical history suggesting some cause for potassium depletion. In interpreting the serum potassium level, the physician should bear in mind that acute alkalosis can produce hypokalemia in the absence of a deficit in total body potassium, while acute acidosis *per se* can increase the serum potassium concentration into the normal range even in the presence of a reduced total body potassium.

Information for Patients

Physicians should consider reminding the patient of the following:

To take each dose without crushing, chewing, or sucking the tablets.
To take this medicine only as directed. This is especially important if the patient is also taking both diuretics and digitalis preparations.

To check with the physician if there is trouble swallowing tablets or if the tablets seem to stick in the throat.

To check with the doctor at once if tarry stools or other evidence of gastrointestinal bleeding is noticed.

Laboratory Tests

Regular serum potassium determinations are recommended. In addition, during the treatment of potassium depletion, careful attention should be paid to acid-base balance, other serum electrolyte levels, the electrocardiogram, and the clinical status of the patient, particularly in the presence of cardiac disease, renal disease, or acidosis.

Drug Interactions

Potassium-sparing diuretics: see WARNINGS.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies in animals have not been performed.

Pregnancy Category C

Animal reproduction studies have not been conducted with Slow-K. It is also not known whether Slow-K can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Slow-K should be given to a pregnant woman only if clearly needed.

Nursing Mothers

The normal potassium ion content of human milk is about 13 mEq/L. It is not known if Slow-K has an effect on this content. Caution should be exercised when Slow-K is administered to a nursing woman.

Pediatric Use

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

One of the most severe adverse effects is hyperkalemia (see CONTRAINDICATIONS, WARNINGS, and OVERDOSAGE). There also have been reports of upper and lower gastrointestinal conditions including obstruction, bleeding, ulceration, and perforation (see CONTRAINDICATIONS and WARNINGS); other factors known to be associated with such conditions will be present in many of these patients.

The most common adverse reactions to oral potassium salts are nausea, vomiting, abdominal discomfort, and diarrhea. These symptoms are due to irritation of the gastrointestinal tract and are best managed by taking the dose with meals or reducing the dose.

Skin rash has been reported rarely.

OVERDOSAGE

The administration of oral potassium salts to persons with normal excretory mechanisms for potassium rarely causes serious hyperkalemia. However, excretory mechanisms are impaired or if potassium is administered rapidly intravenously, potentially fatal hyperkalemia can result (see CONTRAINDICATIONS and WARNINGS). It is important to recognize that hyperkalemia is usually asymptomatic and may be manifested only by increased serum potassium concentration (6.5-8.0 mEq/L) and characteristic electrocardiographic changes (peaking of T waves, loss of P wave, depression of S-T segment, and prolongation of the Q-T interval). Manifestations include muscle paralysis and cardiovascular collapse for cardiac arrest (9-12 mEq/L).

Treatment measures for hyperkalemia include the following: (1) elimination of foods and medications containing potassium and of potassium-sparing diuretics; (2) intravenous administration of 300-500 mEq of 10% dextrose solution containing 10-20 units of insulin per 1,000 mL; (3) correction of acidosis, if present, with intravenous sodium bicarbonate; (4) use of exchange resins, hemodialysis, or peritoneal dialysis.

In treating hyperkalemia in patients who have been stabilized on digitalis, too rapid a lowering of the serum potassium concentration can produce digitalis toxicity.

DOSE AND ADMINISTRATION

The usual dietary intake of potassium by the average adult is 40-80 mEq per day. Potassium depletion sufficient to cause hypokalemia usually requires the loss of 200 or more mEq of potassium from the total body store. Doses must be adjusted to the individual needs of each patient but is typically in the range of 20 mEq per day for the prevention of hypokalemia to 40-100 mEq per day for the treatment of potassium depletion. Large numbers of tablets should be given in divided doses.

Note: Slow-K slow-release tablets must be swallowed whole and never crushed, chewed, or sucked.

HOW SUPPLIED

Tablets—600 mg of potassium chloride (equivalent to 8 mEq) round, but colored, sugar-coated (imprinted Slow-K)

Bottles of 100 NDC 0083-0165-3

Bottles of 1000 NDC 0083-0165-4

Consumer Pack—One Unit

12 Bottles—100 tablets each NDC 0083-0165-6

YOCON®

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Smoking Cessation in Primary Care Settings

C. TRACY ORLEANS, PhD

A cyclical model for quit smoking treatments in primary care settings is based on studies of primary care quit smoking interventions¹⁻⁵ and on research showing quitting smoking is a self-change process.⁶ The four major stages through which a quitter may cycle on any given attempt are: precontemplation, contemplation (deciding to quit), action (preparing to quit and quitting), and maintenance of nonsmoking. Strong support for quitting as a multistage process dictates that primary care strategies involve persistent efforts over repeated contacts, not just "one-shot" interventions.

C. Tracy Orleans, PhD, is affiliated with the Fox Chase Cancer Center, Philadelphia. Reprint requests should be sent to Dr. Orleans, Smoking and Health Consultants, Inc., 355 Walnut Lane, Princeton, NJ 08540.

The proposed model outlined in the Figure incorporates elements of triage and staging into a stepped-care approach that offers smokers more specialized or intensive help as they progress through the various stages of smoking cessation, e.g. precontemplation-contemplation-action maintenance or "recycling," or through repeated quit attempts.⁷ Specific suggestions are made for: creating a practice en-

vironment that encourages nonsmoking and minimizes barriers to quit smoking interventions; and providing a variety of opportunities for smoking patients to acquire, over time, the motivations, skills, and supports for successful smoking cessation. Practical suggestions are given for physicians and allied health care providers functioning in a variety of primary health care settings, e.g. solo practice, small-group office practice, HMO, public health, hospital clinic.

A FACILITATIVE PRACTICE ENVIRONMENT

As the Figure shows, several steps are involved in creating a facilitative practice environment. Smokers must be identified and recruited to treatment.⁸ Inquiring about smoking status can be done as part of the routine assessment of vital signs. Notation should be made in the charts of all patients needing quit smoking treatment (smokers, recent quitters, or relapsers). Many quit kits designed for office practice include chart stickers for this purpose. Of course, smokers can be recruited into practice-based or community quit smoking treatments through posters and announcements placed in the practice or sent through the mail.

There should be visible evidence of a nonsmoking orientation in the practice with "Thank You for Not Smoking" signs prominently posted. The smoking ban must apply equally to patients and staff. Ex-smokers on the staff might wear "I Quit" buttons to identify themselves as resources for smokers planning to quit. Patient education materials should be displayed in waiting and treatment areas.

Most physicians and allied health care staff need to be motivated (or remotivated) and trained to intervene effectively. Although physicians view smoking as a very serious health risk and feel responsible for helping their patients quit, national surveys show that only two-thirds of physicians routinely advise most of their smoking patients to quit, and fewer than one-quarter of physicians regularly offer systematic treatment in their practices or suggest outside referral.^{9,10}

Pessimism about patients' abilities to quit smoking, physicians' lack of training or lack of confidence in their own counseling skills, and a lack of confidence in outside treatments are cited as the major obstacles to more aggressive antismoking efforts.^{9,11} This pessimism is not surprising given that physicians are likely to have "failed" often in the past; the typical primary care intervention is likely to have motivated smokers to try to quit, but not to have supplied the patient with the skills or supports necessary for lasting behavior change.^{9,12}

Physicians need to learn to use cost-effective backup self-help and intensive behavior change treatments. Moreover, physicians need to set realistic goals for their efforts in order to keep a positive outlook, i.e. if treatments succeed in getting 1 out of 10 smokers to quit, this would more than double the annual national quit rate of 2 to 4 percent.¹³ Unfortunately, medical school curricula usually do not offer training in medical quit smoking counseling and referral.¹⁴ Up-to-date training is motivational and behavior change strategies will be a prerequisite for quit smoking programs in most primary care settings. Such training can be accomplished in brief CME-type sessions.^{1,15}

It is essential that organizational, financing, and staffing barriers to quit smoking intervention be removed or minimized. Important practical barriers physicians often cite include: lack of time; lack of coordination between the primary care setting and

community-based quit smoking programs and resources; and lack of third-party reimbursement for smoking cessation counseling.⁹ Emphasizing minimal contact treatments and relying on allied health care staff for more time-consuming counseling and follow-up, will minimize demands on physician time. Maintaining an up-to-date roster of state-of-the-art community programs/resources, and routinely following up on patients referred to these treatments, will help to assure greater and more appropriate use of outside treatments. Efforts to secure third-party reimbursement for the treatment of tobacco de-

pendence should be continued.

PRIMARY CARE INTERVENTION

Whether they quit on their own or in a formal treatment program, smokers are more likely to succeed if they possess quitting motivations and expectations, employ certain quitting and self-management skills, and can draw on social support and psychosocial resources in their efforts. Table 1 summarizes these factors, incorporating the smoking habit variables associated with successful quit-

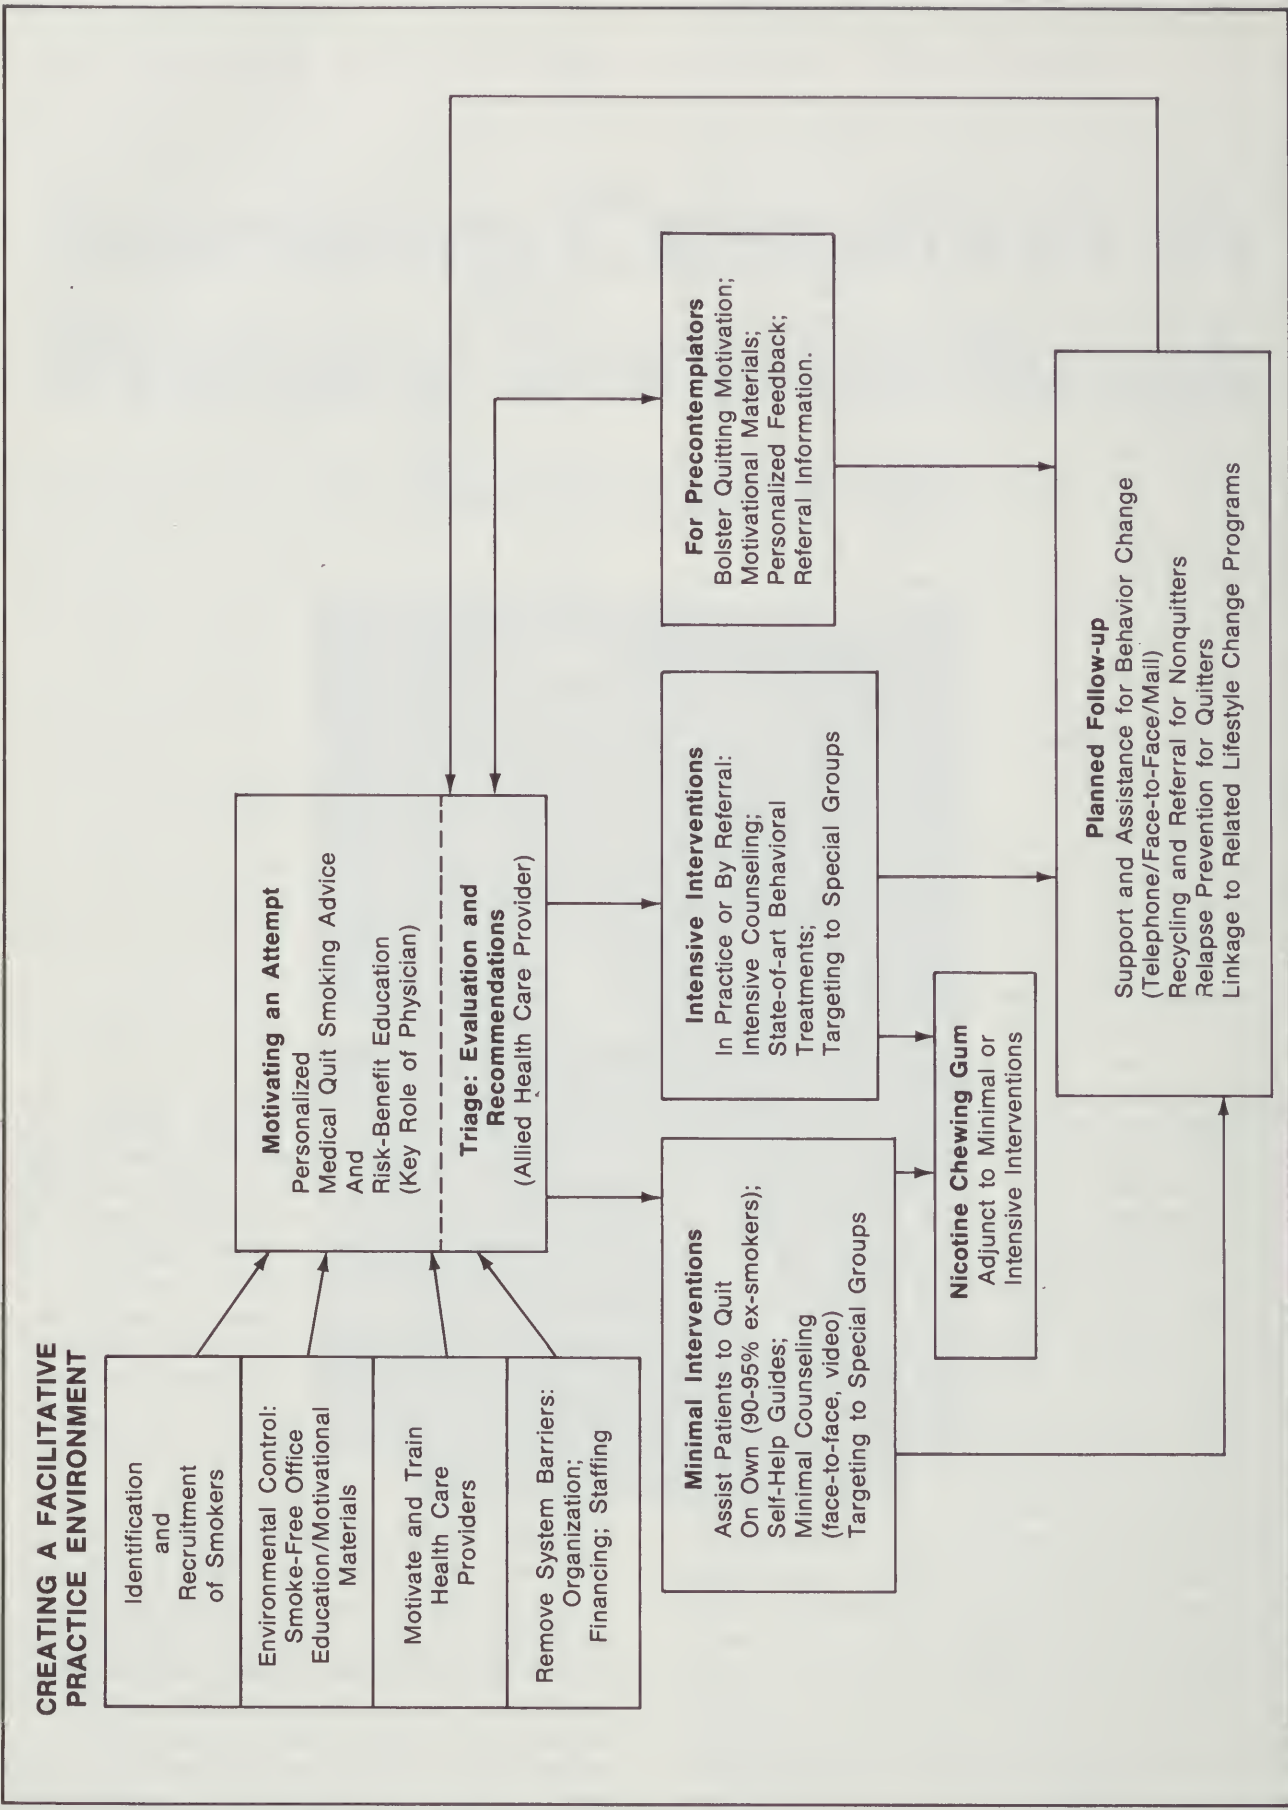

Figure. Model for a primary care smoking cessation initiative.

ting.^{2,12,16-22} The most effective primary care interventions will be those that: 1) equip smokers with these requisite motivations, skills, and supports, and 2) help smokers deal with quitting obstacles, and with aspects of their smoking habit and general health lifestyle that might present special difficulties. The provider can use Table 1 as a "check-list" to guide personalized risk education/advice and to help select an appropriate initial quitting program, and any needed adjunctive treatments, e.g. weight control, stress management training.

1. A Cyclical Stepped-Care Treatment Model. Primary care interventions start with personalized medical quit smoking advice and risk-benefit education (Figure). The purpose of this initial step is to enhance quitting motivation among smokers, both contemplators and precontemplators, setting the stage for a serious quit attempt.

The single most important reason people have for quitting smoking is concern over their health, and smokers who quit for health reasons are more likely to succeed.^{5,18,19-22} Feeling personally vulnerable to smoking health risks and being troubled by reversible smoking-related symptoms (like coughing, wheezing, and shortness of breath) are especially likely to cause quit attempts.¹⁹⁻²² To enhance health motivation, physicians should offer straightforward risk-benefit education, informing the smoker of his/her personal health risks from continued smoking, highlighting any present smoking-related symptoms or illnesses, and emphasizing the health benefits of quitting smoking.^{3,19,21} Health risk information should be conveyed matter-of-factly, without scare tactics that can boomerang creating high levels of anxiety that may lead to increased smoking. Since medical advice is likely to carry the greatest weight coming from a physician, the physician should play the key role in this brief motivating intervention.

After reviewing personal health risks and benefits, physicians should talk with patients about their interest in and motives for quitting, and about any past quit attempts or obstacles. The facts are that 90 percent of smokers would like to quit, 60 percent have tried, and 66 percent are concerned about personal health harms.^{19,23} Hence, most smokers already are contemplating quitting. Reviewing past attempts gives valuable opportunities to assess and bolster quitting motivation, and will help to indicate the most appropriate treatment plan. For instance, brief probing will reveal whether past difficulties involved initial withdrawal difficulties, longer-term negative side-effects (e.g. weight gain, stress), a lack of social support, and/or reliance on ineffective quitting strategies or programs.

Although smokers want to quit, many smokers are likely to have given up on their ability to succeed, or on the value of outside help. Their pessimism

AMERICAN CANCER SOCIETY

Poster from The American Cancer Society, 1981.

springs from unsuccessful past attempts, too often with products and programs that have no demonstrated ability to help them—e.g. free health education clinics, one-shot hypnosis, acupuncture, filters, lozenges, and untested self-help guides or treatments.^{16,19,23,24} Since successful quitters possess greater self-mastery motivation and quitting confidence, medical advice should seek to bolster both. Like their physicians, smokers need to be re-motivated. Past "failures" should be re-interpreted as evidence of serious quitting motivation in the absence of needed support, skills, and resources. It should be explained that quitting usually involves "trial and error" learning over repeated attempts that most successful ex-smokers made more than one attempt before succeeding, and that most smokers who try to quit eventually do succeed.²⁵

Successful quitters expect quitting to be easier and expect more benefits from quitting than do continued smokers or recidivists.^{5,16,18,21} Many smokers try to quit, often relapsing in the face of strong unpleasant physical and emotional withdrawal reactions. Medical advice should emphasize that withdrawal effects—cigarette cravings, impaired productivity and concentration, irritability, disturbed sleep, productive coughing—are transient and fol-

lowed by many long-term improvements in mood and well-being. Specifically, smokers need reassurance that these symptoms are temporary and can be eased with behavioral coping tactics such as deep breathing and nicotine chewing gum.²⁶

Fears that commonly deter smokers from trying to quit also should be addressed: weight gain, an inability to relax, and a persistent sense of loss. Patients need to know that weight gain is not inevitable and generally averages less than ten pounds; weight gain can be avoided or reversed with standard strategies for cutting caloric intake and increasing exercise.^{5,18,19,27} State-of-the-art behavioral quit smoking programs include guidelines for limiting or preventing weight gain through low-calorie snacks, dietary restraint, and regular exercise.^{28,30} Although smokers believe they need cigarettes to relax, much of the relaxing effect of smoking is relief from nicotine withdrawal and associations with relaxing activities often paired with smoking, such as taking a break or being with friends. Again, standard behavioral treatments teach alternative ways to relax, and introduce exercise as a stress management aid.^{28,30} Finally, smokers fearing a lasting sense of loss or sadness after quitting should be advised that these reactions generally do not persist. In fact, within the first year of quitting, ex-smokers report less anxiety and depression, better control over their health, and less frequent use of drugs or alcohol to relax.²⁷ However, since smokers experiencing high levels of stress or depression would be expected to have a harder time with initial withdrawal reactions, deferring a quit date until life stress and depression are under better control is wise, unless medical need to quit is urgent.

Medical risk/benefit education should culminate in firm, unambiguous advice to quit smoking, with a clear offer of assistance. For instance, the physician might say: "I strongly recommend that you quit smoking to avoid (more) serious health consequences. If I give you some help, are you willing to set a quit date and give it a try?" Most smokers will accept this offer, leading directly to the step of selecting an appropriate treatment, setting a quit

date, and arranging planned follow-up. However, smokers who still are in the "precontemplation" stage may not.

2. Selecting a Treatment.

Triage. After the physician has elicited a quit smoking commitment, the next step is to select the appropriate behavior change treatment. The physician (or allied health provider) should review the treatment options, taking into account the patient's preferences and any specific quitting needs revealed in preceding discussion of quitting barriers and past quit attempts.⁷ The smoker should be involved actively in making an informed treatment choice. Then the treatment of choice should be reviewed in enough detail that a definite quit date and follow-up date can be established.

The physician may be able to make a confident recommendation based on the preceding interview evaluation, but an additional evaluation (interview or questionnaire) of smoking patterns and quitting needs also could be conducted. If further evaluation is warranted, it might be handled by another staff member who has the time and training for this activity. In fact, at the triage step, the physician may want to turn the patient over to a staff member who would review the chosen treatment with the patient, set a specific quit date and follow-up date, and offer minimal counseling.

When to start with minimal intervention. Minimal self-help interventions provide the best starting point for the majority of smokers. If the smoker prefers a "do-it-yourself" approach, is fairly confident about quitting on his own, appears to have adequate support among family, friends, and co-workers, and has adequate coping skills and resources, triage to a self-quitting program makes sense.²³⁻²⁵ Patients who possess many of the motivations, skills, and characteristics summarized in Table 1 have succeeded in staying off cigarettes six months or more in previous attempts, and those who have achieved success with other self-directed lifestyle changes are especially good candidates for self-quitting.⁷

When intensive treatment may be needed. More intensive face-to-face treatment often is suggested when the patient: expresses a preference for the structure and support a clinic, group, or counselor can provide; has many prior self-quitting and/or formal treatment failures; has very little confidence in his self-quitting ability; lacks adequate social support for quitting at home and work; or has health lifestyle problems or coping skill deficits likely to substantially interfere with quitting.

Nicotine chewing gum? Nicotine chewing gum is suitable as an adjunct to self-help and intensive treatment programs, and should be considered for smokers who appear highly physiologically depen-

dent, particularly heavy smokers (25 or more cigarettes/day), and those who suffered severe withdrawal problems in previous quit attempts. Nicotine chewing gum has been found helpful in reducing nicotine-related withdrawal (e.g. irritability, impatience, anxiety, difficulty concentrating, drowsiness, restlessness) and significantly boosting quit rates of medical and behavioral quit smoking treatments.^{16,31-35} Outcome studies indicate that the benefits of gum use vary in direct proportion to the efficacy of the treatment with which it is paired, and that the gum used alone has no long-term advantage over a placebo.^{12,33} Possible problems of long-term gum dependence by quitters and nonquitters alike indicate the need for careful follow-up to monitor gum use.³⁶

Findings suggest the greatest benefits of nicotine gum are for more highly nicotine-dependent smokers.³⁴ Nicotine replacement would not be appropriate in the face of medical contraindications, e.g. pregnancy, lactation, recent myocardial infarctions, arrhythmias, severe angina, temporal mandibular joint disease or complications (hypertension, peptic ulcer, cardiovascular disease, or insulin-dependent diabetes).³⁸

3. Minimal Interventions: Assisting Patients To Quit On Their Own. Helping patients to quit on their own is the most cost-effective primary care strategy. This involves furnishing the smoker with a state-of-the-art self-quitting guide and providing minimal counseling in self-help quitting/maintenance strategies, including setting a definite quit date and arranging for followup contact. Self-help strategies are reasonably successful; 15 to 20 percent of quitters will still be off cigarettes one year later, and about 60 percent will succeed through repeated attempts over a lifetime.^{13,19,23,25}

Self-help guides/programs. Quit kits and guides suitable for office-based medical interventions are available and contain brief advice on how to counsel smokers, quit smoking prescription pads, office posters, "smoker" labels for charts, and self-help materials for smokers. The quit kits do not offer a comprehensive guide for smokers; therefore, self-quitting guides should be used as supplements. Table 2 lists a number of "quit kits" and guides suitable for primary care intervention.

Self-help guides take quitters through three stages of quitting: (1) contemplation and decision; (2) action; and (3) maintenance of nonsmoking. Most of the guides include support materials for the quitter's friends and family.²⁸⁻³⁰ One program features a segmented home video cassette to be viewed once a day over 13 days while following a concordant viewers' guide.⁴⁰ Prochaska and DiClemente and colleagues have developed a set of quitting guides for each of the stages of quitting.^{41,42}

THANK YOU FOR NOT SMOKING

Patients using these guides after receiving medical advice to quit would be expected to achieve significantly higher quit rates than patients receiving quit advice only. Usual one-year quit rates for medical quitting advice alone are 5 to 10 percent for predominantly healthy patients, 10 to 30 percent for high-risk patients and those with chronic smoking-related illnesses, and 40 to 60 percent for recent myocardial infarction victims;^{1-5,19} these rates are based on results for all smokers, including those who are not thinking about quitting at the time.

Used without medical quitting advice/referral by predominantly healthy, self-selected quitters, the self-help guides would be expected to produce one-year quit rates of about 15 percent.^{30,43} Quitters who select self-help programs probably represent a subset of all self-quitters who feel they need some outside help to succeed. Better outcomes would be expected for patients using these guides following personal quit smoking advice or counseling from a physician.^{30,44}

Minimal counseling. Brief behavior change counseling reviewing self-help materials would be likely to boost quit rates. Two counseling practices appear especially important: advising patients to set a specific quit date and scheduling definite follow-up contacts.^{1,3,7,44} Physicians, office staff, or videotaped presentations may furnish this counseling. An example of an effective minimal counseling strategy comes from a randomized clinical trial with low-income pregnant smokers in a public health maternity clinic.⁴⁶ All women received five minutes of medical advice to quit smoking during their initial prenatal visit. Control subjects received no further assistance; treatment group received standardized ten minutes of counseling in how to quit using the standard American Lung Association self-help guide,²⁸ and a pregnancy-focused treatment group received ten minutes of counseling in using a pregnancy-focused self-help guide. Clinic-based counseling was provided by health educators. Biochemically validated end-of-pregnancy quit rates showed a clear advantage for treatment group subjects receiving brief counseling (6 percent) and materials targeted

to pregnant smokers (14 percent) over control subjects (2 percent).

4. Intensive Interventions. Formal treatment programs and intensive behavior change counseling are important backups for minimal interventions. Intensive treatments in the practice or from outside referral generally offer help beyond that available in do-it-yourself programs, and tend to attract smokers seeking extra help.

Overview of effective intensive treatments. Commercial clinics, noncommercial clinics, and clinics conducted in medical settings usually offer some combination of group support and health education, and teach a variety of behavioral quitting strategies

and nonsmoking maintenance skills.^{5,16,17,19,23} Better programs avoid fear-arousing tactics and emphasize behavioral nonsmoking and self-management skills (relaxation/deep breathing techniques, cognitive and behavioral strategies for coping with withdrawal, resisting or recovering from a slip or relapse, and self-reward). Most of these clinics produce one-year quit rates of 15 to 25 percent with smokers who seek treatment (and therefore may be less likely to quit on their own), rates as good as or better than those achieved by unaided quitters.^{5,16-19,23}

Two research breakthroughs in the past decade have helped to establish treatments with 30 to 50 percent one-year quit rates: (1) the refinement of noninvasive biochemical markers of smoking status (carbon monoxide levels in alveolar breath samples, thiocyanate, and cotinine levels in saliva samples) allowing for objective verification of treatment outcomes; and (2) programmatic research identifying effective multicomponent psychological-behavioral treatments incorporating "aversive smoking" and "nicotine fading" techniques.^{5,16-19,23,24}

One group of effective state-of-the-art treatments combines broad spectrum nonsmoking skill training with "aversive smoking" methods designed to dampen the desire to smoke and fortify resistance to smoking temptations by conditioning an aversion response to the tobacco smoke.^{5,16-19,23} Aversive smoking takes place in two or more five-to-ten minute trials during group or individual treatment sessions: techniques range from potentially dangerous "rapid smoking" to smoking, puffing, or smoke holding no more dangerous than normal smoking. Another group of successful multicomponent treatments incorporates nicotine fading: switching to brands with progressively lower nicotine deliveries over three to six weeks before quitting abruptly in order to minimize nicotine dose and nicotine-related withdrawal reactions.^{30,47-49}

Ongoing research increasingly focuses on reducing the high relapse rates that characterize even the most effective treatments.^{17,23,35,50} Promising new developments include training new quitters to resist relapse temptations and to recover in the face of a slip or setback.^{29,30,42,50} Programs designed expressly for maintainers—to help them remain smoke-free—and for relapsers also are emerging.^{42,51}

Electric shock treatments or films and lectures emphasizing the health hazards of smoking generally are not effective.^{5,19} Hypnosis, surprisingly, still is relatively untested, and commercially available hypnosis treatments often are unaccountable.^{5,19} Chemicals and dietary treatments such as vitamins, bicarbonate of soda, and tranquilizers, and acupuncture have not been found effective.^{5,16-18,23}

Making an outside referral. It is important to be specific in making an outside referral; the physician

TABLE 1. Factors associated with successful smoking cessation.

Motivational factors

- Desire to protect future health and overcome minor smoking-related symptoms.
- Senses personal vulnerability to smoking health risks.
- Desires greater self-mastery, self-control, or self-esteem.
- Has confidence in ability to quit.
- Expects quitting benefits, e.g. health, social, psychological, cosmetic.

Social Supports/Psychosocial Assets

- Personal medical quit smoking advice and follow-up.
- Support and encouragement from family, friends, and coworkers.
- Strong nonsmoking norms in one's immediate social environment.
- Socioeconomic advantage, e.g. education, income, occupation, employment.
- Psychosocial assets, e.g. self-esteem, self-management skills, good stress coping skills, positive health habits, manageable life stress.

Effective Quitting and Maintenance Skills/Strategies

- Preparation for quitting, e.g. monitoring smoking rate, reviewing reasons for quitting, systematic brand switching to gradually reduce nicotine intake before quitting.
- Quitting abruptly on a target date.
- Using a variety of methods to cope with withdrawal symptoms, e.g. deep breathing, positive thinking, concrete cigarette substitutes.
- Using a variety of methods to remain off cigarettes, e.g. avoiding temptations to smoke, finding alternative ways to relax and cope with stress such as hobbies or exercise, using substitute self-rewards to counteract sense of loss and prevent relapse.
- Taking a long-range, problem-solving approach and making repeated attempts in a cumulative learning process.

Smoking Habit Factors

- Lower smoking rate and nicotine intake.
- Less dependence on smoking to regulate negative affect.
- Past success quitting for six months or longer.

should maintain and annually update a list of local quitting programs. Calling the Cancer Information Service (1-800-4-CANCER) and consulting the free guide to national quit smoking programs published by the Office on Smoking and Health may be helpful.⁵²

Offering intensive treatment in the practice. Intensive treatments can be offered in the practice with sufficient staff and resources. In some cases, with sufficiently large patient populations, treatments can be tailored to specific patient groups.⁵³⁻⁵⁸ Hall et al. achieved favorable results with a low-cost six-session treatment designed especially for chronic cardiopulmonary patients: tailored health education was offered with standard behavioral self-help materials and counseling.⁵³ Several promising intensive treatments for pregnant smokers have been developed.^{54,55}

Multisession treatments are likely to appeal to a smaller percentage of smokers because of their greater demands on patients. Hall found a 38 percent drop-out rate among chronic cardiac and pulmonary outpatients recruited for a low-cost 12-session aversive smoking clinic.⁵³ Hughes offered a free 4-session evening program to pregnant smokers who were interested in stopping smoking and receiving treatment: only 1 of 80 patients accepted this offer.⁵⁶ Likewise, very high (50 to 80 percent) drop-out rates have been reported with cardiac patients randomly assigned to multisession group treatments.⁵⁷⁻⁵⁸

In order to recruit a greater number of patients into practice-based intensive treatments, investigators have condensed face-to-face counseling time, and introduced correspondence formats and telephone counseling to cut the number of sessions involved.^{54,55,58} Ershoff and colleagues converted an effective broad-spectrum behavioral quit smoking clinic into an eight-week correspondence course for women receiving prenatal care through an HMO; after a brief introduction by a health educator, participants were sent weekly mailings outlining the quitting program, and were asked to make three calls a week to a telephone answering service for taped message reinforcing the content of each week's booklet. End-of-pregnancy quit rates for pregnant smokers receiving this treatment (28 percent) were twice as high as for usual care controls (14 percent).⁵⁴

Prue converted a successful nicotine fading program for VA hospital outpatients unable to attend hospital-based clinic sessions; smokers were self-referred or referred by hospital staff. Patients were sent weekly installments of a quitting guide and received brief counseling through weekly phone calls from counselors.⁴⁹ Six-month informant-corroborated quit rates (27 percent) compared very favorably to those reported by wait-list control sub-

jects (10 percent) and to those achieved by comparable clinic-based nicotine fading programs.

One-session treatments in the practice represent another promising alternative. In one study, hospital patients referred by their physicians for an intensive professional 60- to 90-minute consultation were supplied with take-home self-quitting guides and contacted twice at six weeks and six months by phone for follow-up counseling and assessment.⁴⁴ These predominantly hard-core smokers received motivational counseling alone (precontemplators) or with guidance in quitting abruptly either with or without "nicotine fading" (contemplators). Results were comparable to those obtained with multisession clinics: a 27 percent six-month quit rate for all smokers (including precontemplators) and a 31 percent quit-rate for those making a commitment to quit and setting a quit date.

5. Treating the Precontemplator. Patients unwilling to make a definite quitting commitment following medical quit smoking advice should be treated and followed up no less diligently than those who are ready to move into action stages (Figure). At the time of initial advice, the patient should receive take-home motivational materials, referral information, and/or a self-help guide, and be invited to contact the office for help when ready to take further action. A low-key nonjudgmental approach is best for helping these smokers move into a contemplation stage, since their resistance to quitting may be, in part, a reaction against coercive or unsympathetic social pressures to quit at home or at work. Motivational materials for precontemplators should address common quitting barriers and challenge popular misconceptions about smoking and quitting. Prochaska and DiClemente have developed a guide for precontemplators, with exercises and personalized feedback to impart "a more balanced view about smoking" and help move smokers into the contemplation stage."⁴¹

It is important not to underestimate the precontemplator's receptivity to nonjudgmental medical advice and assistance. In one study, 25 percent of precontemplators who declined to set a quit date or commit to a definite quitting plan had quit smoking for 24 hours or more within six weeks of an intervention consisting of personal medical advice to quit with motivational counseling, take-home self-help materials, and warning of follow-up. Half of these quitters still were not smoking at a six-month follow-up.⁴⁴

6. Planned Followup.

Warning of followup. Making arrangements for continued contact through followup calls, visits, or letters enhances the effectiveness of physician advice. Russell and colleagues found that one to two minutes of medical quit smoking advice to unse-

lected smokers resulted in a 3.3 percent self-reported quit rate, but a 5.1 percent quit rate occurred among smokers who also received four pages of quit tips and warning that they would be followed up by the practice.³ Cummings et al. found that physicians who routinely scheduled a followup appointment with patients to monitor their progress had a higher percentage of their patients quit smoking after brief office-based counseling.¹

Timing. Regardless of treatment, a simple, personal followup letter from the physician could serve as a cue to action, fostering compliance with anti-smoking advice. This letter should be sent soon after the visit, repeating quitting advice and congratulating the smoker on setting a quit date, starting a treatment, or taking any steps towards re-evaluating or changing smoking habits for the precontemplator.⁵⁹

The best timing of later followup contacts and visits will depend on the treatment chosen. With minimal treatments, a visit scheduled around the time of the quit date may be especially helpful. Quitters enrolled in intensive treatments may benefit more from end-of-treatment visits. Quitters using nicotine chewing gum should be followed regularly for ongoing instruction in gum use, dosage, and eventual fading.³⁶⁻³⁸ Smoking status should always be re-assessed at subsequent medical visits made for any purpose.

Followup counseling. Actual followup contacts provide opportunities for timely personalized counseling, reinforcement, and problem solving. Wilson and colleagues found that three to five minutes of physician advice to quit and brief cessation counseling resulted in 10.5 percent self-reported 6- to 14-month quit rates.⁴⁵ Higher (19.8 percent) quit rates were observed among patients randomly assigned to receive followup appointments at 1, 3, and 6 months for the purpose of reviewing their progress and providing additional counseling. Low-cost telephone followup has enormous potential for use in primary care settings. In a randomized clinical trial of self-help quitting in an HMO, brief counselor follow-up calls boosted compliance and success with a self-help quitting program.³⁰ Self-referred smokers received a behavioral self-quitting guide and supporter brochure either alone, or with two to four expected brief calls from a Quitline telephone counselor and an invitation to call the telephone Quitline for additional counseling as needed. Counselor-initiated calls boosted the 6- to 8-month quit rate by 50 percent: approximately 14 percent of smokers using the guide alone had quit at the 6- to 8-month followup, while 22 percent of Quitline subjects had done so. Though quitters made very few calls into the Quitline, the availability of Quitline counseling was rated as helpful. National and community quit

smoking "hotlines," including the Cancer Information Service 800 telephone line, offer useful adjuncts for primary care interventions.^{43,51}

Followup with quitters/nonquitters. Contacts with quitters should praise their efforts and success, help them identify which behavior change strategies and nonsmoking techniques are working best for them, and assist them with any unwanted quitting side effects. It may be helpful to discuss referral to other lifestyle change programs offered in the practice or in the community to help the new ex-smoker adjust to his new lifestyle, eg. weight control, exercise.

Nonquitters should receive praise for any steps taken towards quitting, and be helped to identify and overcome quitting obstacles and to reach a new quitting plan and quit date. Precontemplators should be encouraged to continue to re-evaluate their smoking habits and overcome motivational

quitting barriers. Contemplators and those in action stages who have not begun or completed their quitting plan should be encouraged to set a definite quit date. A future followup contact should be scheduled.

Smokers who quit but have relapsed should be helped to analyze the circumstances leading to the setback, and to make a new quitting plan which includes a way to deal with these circumstances in the future. Relapsers should be clued into the "abstinence violation effect"—whereby unnecessary guilt and self-blame after a slip actually can help pave the way to full-blown relapse.⁵⁰ "Well, now that I've slipped and smoked one cigarette, I've really blown it. I guess I just don't have what it takes to succeed. I may as well throw in the towel." Upbeat messages normalizing repeat quit attempts should be given and repeated. Re-cyclers should be encouraged to maintain any changes they have made—using deep breathing instead of smoking, getting more exercise, smoking fewer cigarettes, or a lower nicotine brand—and assisted to select a new quitting strategy and quit date (no matter how far off). De-

pending on the relapser's experience with the initial treatment, and analysis of factors contributing to the relapse, he can be advised to try the same approach again, or to switch to another approach. A definite followup contact should be scheduled. And, as before, it should be clear to the patient and to the physician that each attempt brings the smoker that much closer to permanent nonsmoking, and that different timing, and/or a new approach, may be all that is needed to succeed.

SUMMARY

This paper proposes a cyclical model for quit smoking treatments in primary care settings. Based on studies of physician intervention and research establishing quitting as a multistage process often involving repeated quit attempts, the model incorporates elements of triage and staging into a stepped-care approach that offers smokers more specialized or more intensive help as they progress through the various stages of smoking cessation or repeated quit attempts. ■

FROM LOOKING...TO LIVING...

to smiling again!

The rewards of Limbitrol

in moderate depression and anxiety:

- Rapid results—62% of total four-week improvement within a week versus 44% with amitriptyline¹
- Earlier relief of associated somatic complaints²
- Fewer dropouts due to side effects—only 1/3 the rate of those patients taking amitriptyline, although the incidence of side effects is comparable¹
- Fast improvement with less amitriptyline—1/3 to 1/2 the dose of patients taking amitriptyline alone³

Caution patients about the combined effects of Limbitrol with alcohol or other CNS depressants and about activities requiring complete mental alertness, such as operating machinery or driving a car. In general, limit dosage to the lowest effective amount in elderly patients.

Limbitrol[®] ^{IV}

Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety.

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use; then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction.

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients. (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Use in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to clordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage; withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline; symptoms [including convulsions] similar to those of barbiturate withdrawal for clordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs:

Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, orthostatic heart block, stroke.

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido.

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns.

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of ureters.

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus.

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia.

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue.

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion.

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Overdosage: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. I.V. administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestations and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime. Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly.

Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher doses.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg clordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg clordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500; Tel-E-Dose[®] packages of 100; Prescription Paks of 50.

Tobacco Dependence in Treating Alcoholism

GERALDINE O. DELANEY, LHD

The Little Hill-Alina Lodge Foundation Board was presented the facts available on addiction to tobacco by our Medical Vice-President, Thomas Fleming, MD, and voted 23 to 3 to stop smoking in our treatment center. The staff and students of this alcohol treatment center were given six months to consider this decision, and staff from the American Cancer Society gave lectures and exercises to help those staff members and residents who would be at the center when the no-smoking

policy would go into effect on March 1, 1985. To date, no staff members have left and only two residents have left, saying their reason for leaving was because they could not smoke. The evidence on these residents, however, implied that they were using smoking as the best excuse they could find; their drinking and drug-taking also returned immediately.

Before stopping the smoking at Little Hill-Alina Lodge, we began using decaffeinated coffee, taking sugar off the tables, and incorporating a salt substitute. We always have used a high-protein, low-carbohydrate menu with fresh vegetables, salads, fish, and chicken, along with skim milk, cheeses, and fresh fruit. When people begin to gain weight

Geraldine O. Delaney, LHD, is Chief Executive Officer, Little Hill Foundation. Reprint requests should be sent to Dr. Delaney, Little Hill Foundation, Blirstown, NJ 07825.

from eating too much, we put them on a weight watching diet.

FOLLOWUP

We have not done a formal survey because we wish for the first group to have had at least a year in the community before we survey their drinking, drug-taking, and smoking habits. On casual verbal survey, we find that the women have been having a more difficult time staying abstinent from tobacco than men. Recently, we have established a rule that they may not come back to the center after a therapeutic leave if they return to smoking since their clothes smell of smoke, offending the in-residence students, particularly the women.

What do we do to help the residents when they go home? The group therapy of Alcoholics Anonymous (AA), Narcotics Anonymous (NA), Over-Eaters Anonymous, and Smokers Anonymous always are recommended and explained while they are in residence. We suggest that they go to non-smoking meetings, which are proliferating since more organizations, buildings, and churches are banning smoking on their premises. One recommendation we make as a helping hand is to encourage them to carry pen and notebook, so they will have something to do with their hands. They also can jot down notes that may be helpful to them along the way. We point out to them that in applying for a job, they may not be hired if they smoke, because the chance of illness among smokers is greater and many businesses are looking into this problem very closely.

We believe that it is not sound case management to allow an individual to recover from one fatal illness, alcoholism or drug addiction, while allowing them to progress into another. Cigarettes are every bit as lethal as alcohol and we need healthy role models, hence the insistence that our staff do not smoke. Smoking is not allowed on the grounds of the facility (60 acres) by students, families, visitors, staff, and delivery people. We cannot control what they do at home, but we insist that the staff not appear smelling of tobacco smoke. I believe treatment is assisted by an atmosphere free of any drugs, and we encourage the people to speak freely of their dual addictions, from alcohol to drugs, eating, or tobacco.

The key to recovery from any addiction is facing the truth and deciding what action to take. We give the students a list of some of the lethal chemicals in cigarettes, such as acetone, ammonia, DDT, formaldehyde, methane, phenol, as well as nicotine.

RULES FOR A TOBACCO-FREE LIFE

Recovery from tobacco dependence becomes quite simple, as it is with recovery from drinking and

drugging:

1. Lay the cigarette down and don't pick up Nicorettes® or a pipe.
2. Don't try it—not even one puff.
3. Don't keep cigarettes around the house.
4. Don't carry cigarettes in your mouth, saying that you are not really smoking.
5. Withdrawal symptoms will come, but remember, "This, too, shall pass."
6. At times, the head will tell you that you really don't need to stop—don't listen, for you know better.
7. If you always had a cup of coffee when you smoked, change your routine—a tall glass of water or another beverage. Drinking lots of liquid, especially water, helps.
8. Get friendly with people who do not smoke.
9. Do some deep breathing and regular exercises like stretching or isometrics.
10. Don't sit around after meals if this was a time when you smoked—keep active.
11. Don't sit in the same place you usually sit at meetings; locate the door and sit as far away from it as you can; the smoke will be drawn out the door.
12. Remember, you aren't quitting forever—just one minute, one hour, one day at a time.
13. Be grateful that you don't have lung disease.
14. Being grateful and thinking positive will help a great deal, and group therapy at AA and NA meetings is very helpful.
15. Go to a nonsmokers' organization if there is one around. Sit in no-smoking sections wherever you go. (Even the airlines have almost all their seats nonsmoking, and soon we're hoping for a smoke-free airline.) Remember, nonsmokers are in the majority.
16. Have your clothes cleaned so they don't smell of smoke and spray deodorants in your house and closets every time the odor raises its ugly head.
17. Be careful of secondhand smoke: two-thirds of the smoke from burning cigarettes goes into the environment. Side-stream smoke comes to you as well as smoking a cigarette yourself.

SUMMARY

Tobacco dependence is a common addiction among people who also suffer from alcoholism and other chemical dependencies. Although overlooked for many years, tobacco causes an enormous burden of illness in the people who present for the treatment of other addictions.

Tobacco dependence should be approached therapeutically in the same way as other addictions. The therapist must know the way, show the way, but also go the way, saying, "I can do it, so can you."

Little Hill-Alina Lodge became smoke-free nearly three years ago. The policy has been well accepted. Students are taught how to lead lives free of tobacco as well as other drugs. ■

NEW YORK FERTILITY RESEARCH FOUNDATION, INC.

For the Investigation of
Problems of Human Infertility

The Foundation provides a complete diagnostic and consultation service for infertile couples. Investigations are conducted by well-known specialists in conjunction with consultants in the various fields of medicine related to infertility.

The Foundation is supported by an in-house modern laboratory equipped to do most tests required for diagnosis and treatment. Literature on request.

The Nurse's Role: Decreasing Tobacco Use

ELIZABETH W. WILSON, RN, EdD

*Nurses can act collectively and individually to promote a smoke-free society.
All nurses need to be positive role models as well as agents of change.
Other nursing activities involve identifying and modifying risk behavior
through education and support.*

The functions of the nurse clearly include the promotion of health and the prevention of disease.¹ For this reason, the profession must work collaboratively with other health professions to change the circumstances that promote the initiation and continuation of smoking.

To many nurses and physicians, the traditional role of caregiver is most comfortable. Yet it is not enough to provide compassionate and competent care for the victims of smoking diseases. Such a narrow focus ignores the preventable nature of these diseases.

A literature review by Rosen and Ashley examined role recognition and performance among health professionals concerning the issue of smoking and health. Five major roles were identified: exemplar, educator, identifier-modifier of risk behavior, lobbyist, and researcher.²

EXEMPLAR ROLE

For nurses and other health professionals, the role of exemplar generally is recognized, if not always accepted or welcomed. Once a member of the public identifies a person as a nurse, that nurse becomes either a positive or negative role model whose personal behavior is subject to scrutiny.

In the area of smoking behavior, what does the public see? The 1975 U.S. Department of Health, Education and Welfare study of health professionals reported that 38.9 percent of nurses, 28 percent of

pharmacists, 23 percent of dentists, and 21 percent of physicians were smokers.³ The 1978 to 1980 National Center for Health Statistics survey indicated that 28 percent of nurses and 18.1 percent of physicians were current smokers.⁴ The 1982 American Cancer Society's Cancer Prevention Study II showed that 23.4 percent of nurses, 16.7 percent of physicians, and 14.1 percent of dentists were current cigarette smokers.⁵ The same report adds that another 8 percent of both dentists and physicians smoke cigars or pipes, suggesting that the rate of tobacco dependence in each of these three groups is nearly identical.

A 1984 study of 1,719 registered and licensed practical nurses at a large urban teaching hospital determined that 22 percent of nurses were current smokers.⁶ There is, then, an encouraging implication in these surveys that the prevalence of smoking among nurses is declining.

Whether or not this is a response to increasing acceptance of the exemplar role or just part of a general trend toward smoking cessation is unknown. A correlational study of smokers, former smokers, and nonsmokers among nurses in Connecticut indicates that fewer nurses who smoke agree that nurses should set a good example, should not smoke while working, and should not smoke anywhere in public when in uniform.⁷ Nurses who never smoked demonstrated the greatest commitment to the role of exemplar.

Further decreasing the proportion of nurses who smoke will likely require innovative approaches. For example, a comprehensive effort to provide hospital nurses with worksite smoking cessation programs involving support networks and stress and weight management assistance is underway at the Univer-

Elizabeth W. Wilson, RN, EdD, is Associate Professor, Allied Health/Nursing, Bergen Community College. Reprint requests should be addressed to Dr. Wilson, 19 Highview Terrace, Cedar Grove, NJ 07009.

sity of California.⁸ Evaluation of the study is incomplete, but preliminary findings are promising.

EDUCATOR ROLE

Counseling and teaching are major nursing responsibilities. Nurses spend much time with patients and have a great opportunity to assist them in the goal of smoking cessation. A number of teachable moments occur in the clinical setting: prior to surgery, when every smoker should be told of the benefits of not smoking for at least 24 hours preoperatively, and when it is appropriate to encourage complete cessation; postmyocardial infarction, an introspective time when the nurse has a perfect opportunity to help the patient understand how he can help prevent recurrence; during diabetic counseling to help prevent sequelae; and when counseling cancer patients. Recent evidence suggests that nicotine promotes metastasis and that avoidance of it may improve the odds for survival.⁹

The independent role functions of the nurse include preparing nursing care plans based on assessment. When alterations in respiratory function, peripheral circulation, or blood pressure are related to smoking, a major intervention is to initiate health teaching directed toward assisting the patient to decrease or stop smoking and to find alternative adaptive coping mechanisms.¹⁰

In a 1985 report, the National Cancer Institute estimated that if only 10 percent of physicians incorporated simple smoking intervention techniques into their practices and if only 25 of their patients quit smoking, more than a million individuals could become former smokers each year.¹¹ If the 1.7 million nurses were to collaborate in this educational effort, the effect would be magnified enormously. For this reason, both physicians and nurses need to routinely ask about tobacco use when taking histories and then act appropriately. No patient should remain ignorant of the role tobacco plays in the development or progression of disease. Once educated about this, the patient may be open to further suggestions about smoking cessation.¹²

Increasing numbers of nurses are employed in settings outside of the hospital. Nurses in business, industry, schools, and health maintenance organizations can conduct informational programs, provide self-help materials, and set up mutual support groups for cessation using materials readily available from agencies such as the American Cancer Society, the American Lung Association, and the American Heart Association.

Nurses working outside of the hospital have the opportunity for long-term follow-up. Smoking status needs to be prominently indicated on the patient file. If there is a flag on the chart, the practitioner can be reminded, each time the person is seen, to

express an interest in the progress being made toward smoking cessation.

Nursing education programs need to include relevant data about smoking within their curricula and provide cessation support for students who smoke. Recent nursing textbooks emphasize the nurse's responsibility to be aware of the most recent anti-smoking programs, to be active in these programs, and to interpret them to the public.¹³

Observance of the current New Jersey law which restricts smoking in health care facilities (C319-1 26:3D-7 et seq.) or the successful implementation of a completely smoke-free policy by a hospital depend to a large degree on the commitment of nurses. Any proposal to eliminate smoking in a hospital will necessarily involve the participation of nurses in both planning and implementation.

IDENTIFIER-MODIFIER ROLE

Few people seem to understand the enormous risks of smoking. The public needs to understand three interrelated facts: 1) the magnitude of the risk from smoking; 2) the individual's probability of dying from smoking-induced diseases; and 3) the risk of dying from smoking, relative to that from other causes of death.¹⁴ For example, although many believe that motor vehicle accidents are a greater risk than smoking as a cause of death, the chance of a 35-year-old man dying of such an accident before age 65 is 0.7 percent and before age 85 is 1.0 percent. Yet a heavy smoker has a risk of dying from smoking that is 16 percent by age 65 and 36 percent by age 85.¹⁴

In order to overcome the effects of regular media reports about hazards of far less significance, smokers need to know how tobacco affects them personally. Smokers overlook the fact that cilia are being damaged every day by hydrogen cyanide in inhaled cigarette smoke. Nurses need to identify smokers as individuals with exceptionally high risk for disease and attempt to modify that risk. A pregnant woman needs to know that the oxygen supply of her baby is being compromised. A patient who is reluctant to have an appropriate x-ray needs to know that cigarettes cause daily exposure to radiation. A person concerned about the additives used to preserve food should be educated about the chemicals used in growing and processing tobacco.

It is important to understand that nicotine is an addictive drug.¹⁵ Because nicotine is addictive, strategies for intervention need to be designed with recognition of the dependency factor. Reluctance to intervene with smokers in managing tobacco dependence may be related to a lack of preparation for this role. Continuing education programs can assist nurses and others to use the resources that already are available. Research programs are providing ad-

ditional information about optimal ways of supporting smokers in their efforts at cessation.

LOBBYIST ROLE

As individuals and as members of professional associations, nurses can be effective lobbyists for decisive action to control smoking. Representatives of the New Jersey State Nurses' Association (NJSNA) helped lobby for the passage of the New Jersey clean air laws and the NJSNA is committed to working for further legislation. In 1984, NJSNA submitted five resolutions which were adopted by the American Nurses' Association; the adoption of the resolutions represents a national commitment by nurses to reduce smoking among nurses, to involve nurses in research on smoking behavior, to educate nurses to the hazards of smoking, and to influence public policy to accelerate the decline of smoking.¹⁶

Nurses can lobby individually in a very effective way by insisting that clean air policies be implemented in local school, community, and workplace settings.

RESEARCHER ROLE

Nurses should assume a greater role in research. Funding is available from the National Center for Nursing Research at the National Institutes of Health for nurses who are prepared to submit grants for work in health promotion and other areas. Vital areas of research for nurses include: smoking behavior in nurses; coping mechanisms of nurses; effectiveness of cessation programs for nurses; survey of nursing education for content related to the risks of smoking; and the effectiveness of interventions in assisting patients to stop smoking.

tion, February 3, 1987.

Informal research opportunities are available as well. An oncology unit staff, for example, may keep a record of all admissions to see what percentage of patients are or were smokers; or a hospital nurse may conduct research on the smoking policy in the hospital and how it is working.

The participation of nurses in active research would be facilitated by a PhD in nursing program in New Jersey. Undergraduate and Master's programs in nursing now are placing greater emphasis on research. Presently, fewer than 100 New Jersey nurses have doctorates.¹⁷ There is a need for nurses who are better prepared to carry out research.

SUMMARY

Nurses are a valuable resource in the effort to reduce the prevalence of tobacco dependence. Administrators, public health planners, and policy makers should be encouraged to engage the support of nurses for public education, cessation strategies, and actions to promote smoke-free environments.

Studies have shown that most nurses do not smoke and therefore are performing the exemplar role. Those who continue to smoke should receive assistance at the worksite. More research is needed to determine the most effective strategies for assisting nurses to manage tobacco dependence.

Hospital nurses spend more time with patients than any other health professionals. For this reason, nurses should be in a position to identify patients at risk of health consequences from tobacco dependence, and they should be able to intervene appropriately. Community nurses can help lobby in the effort to work towards a smoke-free society. ■

WHAT GOES UP, BETTER COME DOWN.

Many of the 60 million Americans who have high blood pressure don't know it. You could be one of them.

So call the Red Cross and have your blood pressure checked. Because high blood pressure means a high risk of heart attack or stroke. And, unfortunately, the law of gravity doesn't affect it.

Clean Air At Work: It Makes Sense

REGINA CARLSON

This unusual message is printed in 11 languages by Ecusta, a major manufacturer of cigarette paper.

Clean indoor air policies in the workplace are a potent part of creating a cultural environment that supports nonsmoking and health instead of addiction and disease. There are several reasons for this: most people spend many of their waking hours at work; employers have authority to set behavioral standards which employees must

meet; and workplace standards influence standards in other sites.

Yet, employers have been hesitant to create clean indoor air policies in their workplaces. There are several possible explanations: society has allowed smoking considerable social respectability; cigarettes are one of our most heavily advertised products and the tobacco industry is a powerful political force; and smoking is an addiction that is difficult to deal with in a sensible manner.

To help decision makers overcome trepidation about creating nonsmoking policies, here are some perspectives and solutions:

1. It always is difficult to look objectively at some-

Ms. Regina Carlson is the Executive Director of the New Jersey Group Against Smoking Pollution (GASP). Requests for reprints should be sent to Ms. Regina Carlson, New Jersey Group Against Smoking Pollution, 105 Mountain Avenue, Summit, NJ 07901.

thing that is part of the status quo. Imagine this scenario: A representative of X Cigarette Company comes to your workplace saying, "We'd like to market our product in your company. It comes in these snazzy packets with pretty red letters and foil wrappers. We will supply machines to dispense the product conveniently to your employees at work. Of course, one-third of your employees who use our product will get heart disease and one-tenth of the users will suffer lung cancer, a disease that is rare in the absence of our product. Users will be absent twice as frequently as nonusers. Employees using our product also will make nonusers ill and will anger them. Nonusing employees may sue you for protection from our product. Byproducts will damage delicate electronic equipment in your company. You will have higher fire insurance. There will be increased ventilation problems. Carpets will be burned." What employer would buy that bill of goods?

2. Asking people to limit smoking at work is normal outside office workplaces. School teachers, nurses, bank tellers, retail clerks, and assembly line workers (including those who operate machinery making cigarettes) smoke only on their breaks.

3. Evaluate tobacco smoke in your workplace as compared to other standards applied to other substances in the workplace. We do not know what is in cigarette smoke. Cigarettes have been excluded from laws requiring disclosure of ingredients. John Banzhaf, Executive Director of Action on Smoking and Health, said, "I could go out tomorrow and manufacture a cigarette made of tobacco, saccharin, arsenic, and horse manure, and I'd be subject to almost no government regulation." Of course, we do know many of the constituents of cigarettes and tobacco smoke. Nicotine and carbon monoxide usually come to mind. The American Lung Association reports that an office worker sitting next to a two-pack-a-day smoker is exposed to carbon monoxide levels twice as high as allowed by the Occupational Safety and Health Administration (OSHA) in industrial settings. Ammonia and hydrogen cyanide are present in tobacco smoke. By standards of protection from occupation hazards, cigarettes have no place in the workplace.

4. Compare how employers respond to other health problems and other drug addictions that may affect their employees. They offer withdrawal programs, education, testing, inoculation, and incen-

tives. Kenneth Warner, chairman of the Department of Public Health Policy of the University of Michigan School of Public Health quantifies smoking's impact dramatically: smoking kills more Americans than alcohol, heroin, cocaine, suicide, homicide, auto accidents, fires, and AIDS combined. Companies without clean air policies are encouraging smoking.

5. Industrial workplaces are controlled by environmental pollution laws. Why is indoor air pollution in office workplaces treated so differently? As a member of New Jersey GASP said, testifying

before a New Jersey Assembly committee, "It's illegal to burn leaves outdoors. How come people are burning leaves indoors where I work?"

6. Jacquelyn Rogers, the New Jersey woman who founded Smokers, recognizes that smoking certainly is compulsive but she points out that breathing is involuntary. A smoker can choose to be-

come a nonsmoker, can postpone a smoke, can refrain from smoking, or can step outside. A nonsmoker cannot choose to refrain from breathing eight hours a day at work.

7. Consider special facilities for handicapped workers, i.e. ramps and wheelchair-accessible toilets. What environment are you providing for employees handicapped by asthma or heart disease, or for healthy nonsmokers, who probably comprise the majority of your workforce, those who prefer unpolluted air?

8. A useful parallel exists in the process of change our society is pursuing about alcohol. Alcohol and tobacco are our most destructive drugs of dependence because they are our legal and popular drugs. We are recognizing that alcohol is more destructive than we thought and we are working to protect nonusers—by raising the age for drinking and increasing penalties for drunken driving. Employers are offering more programs for addicted employees and ending the use of alcohol at company parties. People are being told to say "no" to friends who want to drive drunk and to be sure to provide nonalcoholic drinks at parties.

We are recognizing that tobacco's toll is much greater than we had thought. We are stepping up efforts to ensure that children remain nonusers and we are protecting nonsmokers with clean indoor air laws. Companies are creating policies. People are putting up signs saying "Welcome to our smoke-free home" and removing ashtrays from their homes. ■

Scientific Basis for Workplace Clean Air

LAWRENCE A. MEINERT, MD, MPH

Smoking is New Jersey's most important cause of preventable disease and premature death. Nearly 11,000 deaths each year occur in individuals as a result of their smoking.¹ In New Jersey alone, smoking produces annual economic losses of nearly \$790 million from increased health care costs and another \$1.3 billion in lost wages and productivity due to illness. These estimates are based upon applying national attributable risk functions on New Jersey mortality and cigarette sales data: cancer deaths, 32 percent; cardiovascular disease deaths, 13 percent; chronic obstructive lung disease deaths, 88 percent; health care costs, \$0.72 per pack; lost productivity, \$1.45 per pack.

DANGER FROM OCCUPATIONAL EXPOSURE

A growing body of evidence indicates that involuntary exposure to tobacco smoke poses a substantial health hazard to nonsmokers. This comes as no surprise to physicians who have witnessed the deadly consequences of tobacco in generations of patients. The main features of the evidence for this are summarized below, following the line of argument of a petition presented in 1987 by Public Citizen Health Research Group and the American Public Health Association to the Occupational Safety and Health Administration which seeks to prohibit smoking in indoor workplaces.

A. Toxic and Carcinogenic Chemicals in Environmental Tobacco Smoke. Several thousand individual compounds have been identified in tobacco smoke. Nonsmokers are exposed primarily to unfiltered side stream smoke, which enters the air directly from the burning end of a cigarette. Since

the combustion temperature is lower when a cigarette is smoldering, side stream smoke actually contains higher concentrations of many of these harmful substances than does mainstream smoke. Carbon monoxide, benzene, toluene, n-nitrosamines, and nicotine are just a few of the compounds found in side stream smoke.²

B. Worker Exposure. Nonsmokers absorb and metabolize smoke constituents just as smokers do, albeit at lower levels. Metabolic products unique to cigarette smoke have been detected in the blood, urine, and saliva of nonsmokers after exposure to environmental tobacco smoke. Although levels vary, the typical office exposure of a nonsmoker to environmental smoke is equivalent to between one-sixth and one-and-a-half cigarettes per day.²

C. Health Effects of Worker Exposure. Numerous studies have documented a dose-response relationship between the number of cigarettes smoked and lung cancer, heart disease, and other diseases. These dose-response relationships suggests that lower levels of exposure such as those experienced by nonsmokers in an office where smoking is allowed are likely to pose a hazard. Studies of passive smoking indicate that the exposure of nonsmokers to environmental tobacco smoke increases the risk of lung cancer by 25 percent over that of individuals who live in smoke-free environments.³ Losses in lung function similar to those of light smokers have been documented in nonsmokers exposed to smoke-filled environments.⁴ Acute decrements in pulmonary function of asthmatics may occur in a smoke-filled environment. Increased heart disease has been observed in nonsmoking women married to smokers;⁵ risk of heart disease was triple over that observed in the control group. A comparable risk may exist for nonsmoking employees exposed at work. Individuals with pre-existing heart disease may experience angina at lower levels of exercise in a smoke-filled environment. Two studies indicate that nonsmoking pregnant women exposed to environmental tobacco smoke for at least two hours a day have nearly twice the risk of delivering a low birth weight baby.^{6,7} Ir-

Lawrence A. Meinert, MD, MPH, is Director, Adult Health Services, Division of Epidemiology and Disease Control, New Jersey State Department of Health, Trenton. ritation of the eyes and nose is a symptom reported by two-thirds of nonsmokers exposed to environmental tobacco smoke.⁸

VENTILATION ISSUES

The actual composition and concentration of environmental tobacco smoke in an enclosed space will depend on a variety of factors, including: the number of cigarettes smoked and the rate at which they are smoked, the type of cigarettes, the size of the room, and the rate air is exchanged by the ventilation system.

However, lighted tobacco products clearly are not the only source of indoor air pollutants. Insulation, carpeting, and photocopy machines can give off a variety of fumes. Increased ventilation with fresh outside air is necessary to reduce exposure to all types of pollutants in an indoor environment regardless of the source.

Increased ventilation will reduce, but not eliminate, environmental smoke exposure. Tobacco smoke is mostly gases which quickly equilibrate throughout an enclosed work space. Even in a private office—unless it is negatively pressurized relative to the adjacent areas—tobacco smoke will escape over or under doors or through open doors. Heavy, aerosolized particulate matter will tend to remain concentrated in a private office. If there is an air intake in that room, however, smoke will be recirculated throughout the building. The only way to eliminate environmental tobacco smoke exposure is to eliminate tobacco smoke from the building's air handling system.^{2,8}

NJ WORKPLACE CLEAN AIR LAW

The accumulating evidence of harm from and changing social attitudes towards ambient tobacco smoke led to the passage in 1985 of NJSA 26:3D-23 et seq. (PL 1985, Chapter 184) which controls smoking in private places of employment.

This law articulates the principle that the right of the nonsmoker to breathe clean air supersedes the right of a smoker to smoke. Private employers with more than 50 employees in a given building are obligated to have a written policy which protects the

health, welfare, and comfort of employees. The law, as currently written, gives employers great latitude in determining what this means in developing their own policies. Unfortunately, some employers have taken a minimalistic view of the law. For instance, some have designated bathrooms as the only non-smoking areas.

Based upon the available evidence of the potentially harmful effects of tobacco smoke, the Health Department has issued a guideline to assist employers as they develop clean air policies for their businesses. The guideline states that where employees spend the majority of their work day should be completely free of tobacco smoke. Smoking-permitted areas are optional, and such areas should be in locations which are not part of the main air handling system. Nothing in the law prohibits an entirely smoke-free workplace. In fact, this often is a popular solution to the problem that the New Jersey State Department of Health and the Medical Society of New Jersey have implemented.

A petition presently before the Federal Occupational Health and Safety Administration seeks to create smoke-free workplaces wherever OSHA has jurisdiction. Such regulation would extend worker protection further than present New Jersey law. As experience with workplace clean air policies accumulates, information is becoming available which will help determine if the New Jersey workplace clean air law should be strengthened to further improve the public health.

SUMMARY

Environmental tobacco smoke contains thousands of compounds, many of which are known to be toxic. Nonsmokers exposed to ambient tobacco smoke absorb measurable levels of smoke constituents. Increased risks of lung cancer, pulmonary dysfunction, heart disease, and low birthweight infants have been associated with the exposure of nonsmokers to ambient tobacco smoke. Complete protection of workers from tobacco smoke in indoor workplaces is only possible if smoking is not permitted except in places with completely separate ventilation systems. ■

The Smoke-Free Hospital

JEFFREY BURTAINE, MD, and JOHN SLADE, MD

Over the past ten years, hospitals throughout the country stopped selling cigarettes; sales seemed inconsistent with the missions of caring for the sick and preventing illness. Since 1983, a growing number of health care facilities have implemented policies to become free of tobacco smoke as well. These policies have been motivated by the evidence that tobacco smoke is both an irritant and a hazardous substance in the environment,^{1,2} by the realization that clean air policies can help set the tone for smoking treatment and prevention efforts, and by the fact that individuals who want to stop smoking may be better able to accomplish this if their environment provides them with opportunities to practice not smoking.

Jeffrey Burtaine, MD, is Director, HealthEast Wellness Center, Allentown, PA. John Slade, MD, is the Guest Editor of this special issue. Requests for reprints should be addressed to Dr. Slade, St. Peter's Medical Center, 254 Easton Avenue, New Brunswick, NJ 08903.

A large experience in industrial settings has demonstrated the popularity of complete bans on smoking in the workplace.^{3,4} It now is clear that clean air policies can be popular in hospitals as well.

In this report, we outline the steps taken to implement a policy in two Pennsylvania hospitals which nearly eliminated smoking; we also review some of the developing information on the experience in other hospitals which have instituted even more complete bans on smoking.

STEPS TO THE CLEAN-AIR POLICY

The Allentown Hospital is a 337-bed community hospital specializing in psychiatry, obstetrics-gynecology, pediatrics, internal medicine, and surgery. Lehigh Valley Hospital Center is a 482-bed acute care hospital, featuring a trauma unit, burn center, and cardiac surgery facilities as well as large general surgery and internal medicine services. The hospitals are part of a multihospital system known as HealthEast. The hospitals implemented the no-smoking policy in April 1986. However, the develop-

ment process began a year earlier. The sequence of events is as follows:

1. The Chief Executive Officer (CEO) approved the policy after presentation of: A) Economic aspects—a smoking employee costs the employer between \$500 and \$1500 more per year than a nonsmoking employee. A person who smokes experiences increased absenteeism, uses more short- and long-term disability, uses more health insurance benefits, and causes more damage to the physical plant itself. B) Leadership—the hospitals should be in a leadership position for health promotion in the community. C) A no-smoking policy was the right thing to do—as smoking is the number one cause of death and disability in the western world.

2. A presentation then was made to the hospitals' management teams to obtain their support.

3. Reports were given at meetings of each major medical and surgical department.

4. Once the various departments had given their approval, the specifics were presented to the Medical Executive Committee. At the Executive Committee meeting, a respected physician voiced what he called the "freedom issue." He suggested that smoking was a matter of personal freedom, and that the next thing to be proposed would be restrictions on overweight people. In the ensuing discussion, it was pointed out that smoking in hospitals is not a simple "freedom issue," because tobacco smoke is a health hazard for all who are exposed to it. Thus, it is quite different from obesity, because an individual's weight is not a health hazard to anyone else.* After debate, the proposal was approved without dissent.

5. A presentation was made before the Employee Relations Panel to start introducing the concept of the smoke-free hospital to employees. The Panel members, smokers, and nonsmokers were very supportive of this concept.

6. A survey of all employees was conducted. Only 22 percent smoked, and half of these indicated that they wanted to quit smoking. A third of all employees favored a complete ban on smoking in the hospitals, a third of the employees preferred smoking in only one area, and a third of the employees wanted smoking to be allowed everywhere.

7. The proposed policy then was presented to the Board of Trustees for approval. The Board gave its approval after reviewing the survey results and hearing of the support the proposal had among the CEO, the managers, the medical staff, and the Employee Relations Panel.

The policy established the hospitals as smoke-free

with two exceptions: one tiny smoking lounge, behind closed doors, would be retained in each hospital for the use of employees and visitors, and inpatients would be permitted to smoke on the written order of their attending physician. The policy indicated that the medical staff should write such orders only if smoking was "necessary" for the "physical or emotional well being of the patient."

8. The policy was presented to department heads, to the department of nursing, and to all employees with an implementation date of April 1, 1986.

9. The program for employees included five elements:

A. All employees who quit smoking would be paid \$100 after they had been abstinent for six weeks. This would be monitored by an honor system based on peer pressure. The employees who received \$100 would have their names posted on a bulletin board in the main lobby and also in the department where they worked. Employees who slipped and returned to smoking could be identified by their co-workers and reported. This happened in two cases.

B. Free stop-smoking courses would be offered to employees and their significant others for 12 months. Both hypnosis and behavior modification were provided.

C. Health counselors would meet with any employee who felt in need of assistance. The health counselor would be available for helping with smoking cessation and with stress management. In addition, the counselor could arrange for the employee to receive a prescription for nicotine gum as needed through the employee health service.

D. No special disciplinary policy was formulated in regards to smoking by employees.

E. To reward nonsmokers, two lotteries for this group were held: in October 1985 and in April 1986. Thousands of dollars in savings bonds were given out as prizes to those who did not smoke.

10. The patient policy was that patients could smoke only on the order of their attending physician. This exception is subject to audit to insure that it is not abused. The admitting office has been instructed to tell patients that the hospitals are non-smoking institutions.

After more than a year, the policy is an exceedingly popular one. Among 4,200 employees, 211 people have quit smoking. This is just under a fourth of those who reported smoking in the initial survey. The smoke-free date, April 1, 1986, came and went without a problem. To date, there has not been one protest or one problem.

DISCUSSION

Clean air can become a reality for most, if not all, hospitals. Clear leadership, thoughtful preparation,

*Among inpatients, obesity often is treated as a medical matter. The diet is under the very specific direction and control of the attending physician.

and caring implementation are key elements for success. In these two hospitals, money, time, and effort expended implementing this policy have been more than justified by the positive results among employees and by the favorable response from the community.

There is a growing national experience with clean air policies in hospitals around the country. Among the first was the policy at Group Health Cooperative of Puget Sound, fully implemented in April 1984, which banned all smoking except for inpatients with a physician's order.⁵ Between 1983 and 1987, nearly the entire Indian Health Service has become completely smoke-free.⁶ An unusual program of technical assistance provided by the University of Minnesota with funding from the state health department has facilitated several dozen hospitals and nursing homes in Minnesota becoming completely smoke-free over the past two years.⁷ The Minnesota program demonstrated so convincingly the feasibility of "clean air health care" that a law was enacted in 1987 requiring all hospitals in that state to be smoke-free by 1990.

The Minnesota law summarizes what may be the practical extent to which clean air policies can be generalized to all health care facilities at this time. The law prohibits all smoking by staff and visitors. There are three optional exceptions for patients, however. Hospitals may elect to permit smoking by patients on written order of the attending physician, and chemical dependency units and mental health units may elect to set aside "a separated well-ventilated area pursuant to a policy established by the administrator of the program that identifies circumstances in which prohibiting smoking would interfere with the treatment of persons recovering from chemical dependency or mental illness." There are no other exceptions.

The Mayo Clinic has chosen to permit smoking by an inpatient only if there is agreement among the patient's physicians and nurses, and if the smoking consultation service concurs.⁸

Policies such as these are popular with patients

and staff. Kottke has reported that almost 90 percent of patients in the University of Minnesota Hospitals supported the establishment of a smoke-free hospital.⁹ Leibowitz could find no patient or visitor at the Beth Israel Medical Center in New York who thought a smoke-free medical center was a bad idea.¹⁰ Beth Israel became smoke-free on May 7, 1987. Most hospital staff, including nurses, do not smoke, and many, if not most, who smoke want to quit.¹¹ Among a wide variety of employee groups, clean air policies have been popular with both smokers and nonsmokers.^{3,4}

State medical societies are beginning to encourage hospitals and state health departments to act on this issue. The Arizona Medical Association passed a resolution in 1985 encouraging hospitals to ban smoking. In 1986, the Medical Society of New Jersey (MSNJ) called for legislation to eliminate smoking in acute care hospitals. In 1987, in cooperation with the New Jersey Group Against Smoking Pollution, MSNJ petitioned the Commissioner of Health to ban smoking in hospitals.¹²

The smoke-free hospital still is novel, but this is not likely to remain the situation for long. The logic for eliminating tobacco smoke from health care facilities is too compelling, and the positive experience with clean air policies to date amply demonstrates the practicality of this approach. Hospitals should protect the nonsmoker by providing clean air, and hospitals should help those who smoke by providing an environment which supports the only medically appropriate approach to tobacco use: abstinence.

SUMMARY

Complete or nearly complete bans on smoking have been implemented in a wide variety of hospital settings since 1983. These policies have been popular and successful. The logic of these policies is compelling, and interest in them is growing. Smoke-free hospitals provide an appropriate setting for caring for the sick, for counseling those who smoke or who are at risk of smoking, and for protecting the health of all. ■

The Joy of Smoking

BONNIE VIERTHALER

During a conversation in a smoke-filled restaurant in the spring of 1986, I was suddenly awakened to the incredible discrepancy between the images in cigarette advertisements and what actually happens when a person smokes. I was outraged to think that somebody would deliberately manufacture a lethal product and then spend millions of dollars deluding people into buying it. "Somebody needs to make the ads honest," I said. My companion asked, "So what are you doing that's more important?" And that's how it all began for "The Joy of Smoking."

It was not easy. Several false starts and several months later, I hit upon a visual format which worked. By using actual cigarette ads from popular magazines and superimposing more honest images from medical journals, I was able to show the illness, death, and social consequences which result from smoking. Once I had the format, it took off like wild fire. The first 40 collages came together in about a month.

While the project began as a sort of practical joke, appealing to the mischievous side of my sense of humor, reactions by the first few viewers suggested that I had created a powerful statement, something which might make a difference. This process was a

Bonnie Vierthaler is the Director of The Badvertising Institute, Deer Isle, Maine. Reprint requests can be sent to Ms. Vierthaler, P.O. Box 643, Deer Isle, ME 04627.

little like giving birth to a child in that the joy of creation ultimately gave way to responsibility. I brought these collages into being. Now my task was to usher them out into the world, to see that they reached the young people. This has become an ongoing mission: to dispel the powerful illusions of glamour conveyed by the tobacco companies and to replace them with more realistic attitudes about smoking.

ON THE ROAD WITH THE SHOW

Fulfilling this mission led to a somewhat frenetic year of traveling to schools, hospitals, health conferences, medical society meetings, shopping malls, and the Rotunda of the Russell Senate Office Building in Washington, D. C. It has been an eye-opening year. Young people candidly shared their poignant concerns about how tobacco was affecting their lives. I heard doctors, health educators, and antismoking activists describe the medical, health, and social issues related to smoking and point out the dubious business practices of the tobacco industry.

Getting the smoking exhibit to young people has been a roller coaster ride. High hopes repeatedly have plunged into disappointment as potentially supportive organizations went from elated, enthusiastic support for the exhibit to limp and embarrassed justifications about why they could not get involved. Some of our nation's largest health organizations fear the power of the tobacco industry. The actual support for my work has come from a few

dedicated individuals and grassroots organizations who understand the importance of reaching the children and who are willing to take a stand.

REFLECTIONS ON A YEAR OF TRAVELING

Back home on Deer Isle for the summer, I was blessed with the opportunity to assimilate and assess the events of the year. The collages and the exhibit have obviously been very well received. My overwhelming impression is that they have filled an important need.

Doctors, teachers, and health care professionals continually express to me their frustration with traditional smoking and health programs. They have told me, despite the variety of antismoking programs available, young people continue to be seduced by cigarette advertisements. "The Joy of Smoking" has been a breath of fresh air for them.

Young people love the exhibit because it focuses on something they are attuned to: advertising! The exhibit is both funny and gross, and it takes pot shots at the establishment—all the things they love to do. By graphically revealing the absurdity of the tobacco ads, the exhibit builds on and gives meaning to what young people already know. They get the message without cumbersome facts and statistics. Furthermore, it dares to do something many have secretly wanted to do themselves: it uses the tobacco companies' own ads to show the truth about smoking. It turns the ads against themselves.

Facts alone are not enough to influence the behavior of young people. While we might change their minds, we also must change their attitudes. My sense is that people usually make decisions on the emotional level and then use their intellects to justify these decisions. The cigarette ads are effective because their visual images implant subconscious concepts in the mind which equate smoking with happy, healthy, economically secure, but adventurous lifestyles. The ads appeal to the emotions by suggesting that these products will satisfy feelings of emptiness, inadequacy, and loneliness. And

they get results! On the other hand, programs which merely dispense facts work on the intellect. They're interesting and informative, but they don't change behavior because they don't impact the emotions. We need to tell the truth about smoking with equally powerful, honest images.

My year of travel with "The Joy of Smoking" has borne out this theory. The juxtaposition of images is proving to be an effective "right-brain" approach to a problem which has not been solved by "left-brain" educational methods. The exhibit works directly through the emotions, in the same way that the original ads do. It fights fire with fire.

I am finding that when young people see the power and hypocrisy of the tobacco ads, they are better able to understand that we are not subsidizing, selling, and smoking cigarettes because it is right, but because our society is consumed by the profit motive. They can see that we have all been victims of a very large mistake, one which can and must change. Moreover, by exposing the truth about cigarette ads, the exhibit puts young people in a position of control. They've caught the tobacco companies in a lie, and that puts them "one-up" on one of the most powerful industries in the country.

SUMMARY

"The Joy of Smoking" is a collection of 67 collages which parody cigarette and smokeless tobacco advertisements. It is designed to undermine the seductive imagery used by tobacco companies in recruiting new users. The emotional appeal of these counter-advertising messages lets the dry truths about smoking and health become genuine knowledge in powerful ways.

The exhibit has been shown in a wide variety of school, community, and professional settings. The reactions from young people and health professionals alike have confirmed the value of this approach in preventing teenage addiction to tobacco. For those interested, the exhibit is available for showings in 1988. ■

NJ State Commission on Smoking or Health

LEE B. REICHMAN, MD, MPH

The New Jersey Commission on Smoking or Health is an innovative partnership between the public and private sectors whose initial report provides a blueprint for attacking the problem of smoking and youth. The Commission is ready to help New Jersey focus on the problems caused by tobacco.

In 1986, New Jersey's then Commissioner of Health, Richard Goldstein, established the Commission on Smoking or Health to serve as an advisory board to the State Department of Health on matters concerning tobacco use and control. It was charged with the development of policy recommendations, suggestions for legislative action, and educational initiatives in this area. Mrs. Thomas H. Kean has served graciously as honorary chairperson of the Commission.

Among the specific topics posed to the Commission in its charge were: to review and evaluate the impact of existing state and local legislation regarding smoking and tobacco use on health; to review and recommend legislative action on clove cigarettes, vending machines, and the advertising of tobacco products; to evaluate the feasibility of differential insurance rates for tobacco users and non-users; to report on the economic impact of tobacco control in terms of health care costs and injury prevention measures such as self-extinguishing cigarettes; and to recommend educational and intervention programs for specific target populations.

Lee B. Reichman, MD, MPH, is Chairman, New Jersey State Commission on Smoking or Health and Director, Pulmonary Division, UMDNJ-New Jersey Medical School. Reprint requests should be addressed to Dr. Reichman, University Hospital, 150 Bergen Street, Newark, NJ 07103-2425.

At the suggestion of Commissioner of Health Molly Joel Coye, the Commission has focused on tobacco and children as the subject of its first report. A public forum on children, teenagers, and tobacco was held in Trenton on November 19, 1986. At the forum, the Commission heard from more than two dozen citizens concerned about this problem. The Commission has prepared a report based on this forum and its subsequent discussions which outlines a program for preventing tobacco dependence in New Jersey's young.

New Jersey is a state whose government and citizens are extremely health conscious. Occasionally, in the zeal to solve the great health problems of the day, perspective about the relative riskiness of various hazards is lost. Thus, problems which may be more tractable politically, such as the abatement of asbestos in public school buildings, are addressed in a comprehensive manner while programs which would be less expensive but more beneficial for the public health, such as the elimination of smoking in all public places in New Jersey, receive less thorough treatment.

The Commission's task is to help New Jersey focus on the prevention of the multitude of problems caused by tobacco.

Tobacco is the leading cause of unnecessary illness and death in our state, and there is much which can be done to bring the tobacco-disease epidemic under control. ■

YOU WILL KNOW THE MOMENT WE KNOW

Good communication with referring physicians is an essential part of our lithotripsy treatment program at the Mid-Atlantic Kidney Stone Center. After the pre-treatment consultation with your patient, we send a full report to you. Post-treatment, we promptly call your office regarding your patient's status. Then we send a complete report to assist you in providing follow-up care. Additionally, we provide each patient with copies of their pre- and

post-treatment x-ray films.

Our medical directors are available for pre- or post-treatment consultation 24 hours a day, 7 days a week. We think you will find that our thorough communications will be of assistance to you during your patient's treatment at the Mid-Atlantic Kidney Stone Center.

In nearly two years of practice as a lithotripsy service, we have

treated more than 2000 patients. Referring physicians from New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware have come to appreciate this unique level of experience as well as our frequent and timely communications. To find out more about our service, or how you can obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337. Outside New Jersey, call (800) 53-LITHO.

Preventing Tobacco Dependence

THE NEW JERSEY COMMISSION ON SMOKING OR HEALTH

Smoking and other forms of tobacco use are the leading causes of preventable illness and death in New Jersey. Over 11,000 of our fellow citizens die each year as a result of diseases caused by smoking. Thousands of others endure the slow agony of illnesses produced by smoking such as emphysema and heart disease. The economic toll of tobacco use in the form of lost productivity and increased health care costs amounts to more than \$2 billion each year in New Jersey.

The magnitude of this public health problem should call us to action. We must move forward in a collective effort to reduce and prevent unnecessary illness due to smoking. The challenge is great, and our response will have to overcome 300 years of cultural and economic dependency on tobacco.

In recognition of the complexity of the issues that surround all attempts to eliminate tobacco related illnesses, an advisory Commission on Smoking or Health was appointed in February 1986. This Commission is comprised of outstanding leaders from many walks of life in New Jersey. They have spent the past year examining ways that we can prevent childhood and adolescent tobacco dependency.

The Commission's report provides a series of recommendations based upon evidence of the potentially harmful effects of tobacco smoke and patterns of tobacco use and addiction in the United States. It is our hope that further debate and public policy change will be stimulated as a result of the Commission's findings.

The Commission has given many hours to the development of this report, and the Department would like to express their respect and gratitude for the Commission's efforts.

*Molly Joel Coye, MD, MPH
State Commissioner of Health*

Tobacco is the leading cause of avoidable illness and death in New Jersey. Every year nearly 11,000 deaths are caused by cigarette smoking.

FINDINGS

1. Magnitude of the public health problem:

(a) Thirteen percent of cardiovascular disease deaths (4,300) are attributable to smoking cigarettes.

(b) Thirty-two percent of cancer deaths (5,000) are caused by smoking cigarettes.

(c) Eighty-eight percent of chronic lung disease deaths (1,600) are caused by smoking cigarettes.¹

The annual economic impact of tobacco on New Jersey is immense^{1,19}:

a. An estimated \$1 billion are spent each year to purchase over 880 million packages of cigarettes in New Jersey.

b. An estimated \$790 million are spent each year as the result of increased health care costs created by tobacco use in New Jersey.

c. An estimated \$1.3 billion are lost each year to the New Jersey economy by decreased productivity and earnings due to illnesses caused by tobacco.

Tobacco use has declined among all age groups except children.² A 1986 high school survey of 10th, 11th, and 12th grade students in New Jersey indicates that almost 40 percent smoke; half smoke every day. These data are unchanged from 1980.

Although data are incomplete, it appears that smoking prevalence among those who drop out of school is higher than it is for those who remain in school. The reported prevalence figure of 40 percent for high school students probably underestimates the size of the problem.

In New Jersey, about 50 percent of teenagers who become pregnant smoke.³ The effects of cigarette

smoking may account for 25 percent of the low birth weight deliveries in this group.⁴

Nicotine produces a chemical dependence (addiction) in exactly the same sense that other drugs, such as heroin, cocaine, and alcohol, are dependence-producing.⁵ About seven out of ten people who use tobacco regularly are addicted to it. Most smokers start smoking as children. Studies indicate that the younger one starts to smoke, the harder it is to quit. When smoking is started at a younger age, many of the diseases produced by smoking are manifested at a younger age. The younger one starts, the more likely one will become ill from smoking.

2. Lack of public awareness and understanding of smoking issues:

The present public concern about the use of alcohol and other drugs by children has not included tobacco. There is a lack of awareness that tobacco is an addictive substance. While most adults and children believe that cigarettes are harmful, the public underestimates the enormous magnitude of that harm.

3. Extensive cultural and social influences encourage children to smoke:

Although tobacco companies claim their advertisements are not directed at children, the themes employed in their \$2 billion annual marketing effort are clearly appealing to a youthful audience. Sporting events such as car races and tennis tournaments are promotional vehicles for cigarettes.⁶ Slim models seem to promise "sexy" vitality from cigarettes.

There are toys which bear cigarette logos. Candy cigarettes and chewing gum cigars still are found in our stores. The most popular brand of bubble gum is an imitation chewing tobacco.⁷ Students learn that smoking is the "adult" thing to do when they are not allowed to smoke on school grounds but teachers are permitted to smoke. (The fervor with which adult smokers cling to smoking lounges only testifies to the addictive nature of their tobacco use.) Government agencies warn against the dangers of tobacco but allow it to be advertised and sold on public property.

4. Easy access to tobacco by children:

A New Jersey law prohibits selling or giving tobacco products to anyone under age 16,⁸ but the Commission has been unable to learn of even one complaint or court case brought under this statute.

The absence of regulatory action is certainly not indicative of widespread compliance with the law. In March 1987, an 11-year old boy readily purchased cigarettes in 19 of 21 attempts without difficulty.⁹ Most tobacco retailers claim unawareness of their precise legal obligations. Cigarettes are readily given to minors during free sampling promotions by cigarette companies. Minors frequently win cigarettes offered as prizes at fairs.

Sales of clove cigarettes, a mixture of cloves and tobacco, are growing. This product's main use may be the initiation of new tobacco users. National experts believe that virtually all clove cigarettes are consumed by minors.¹⁰

Mail-in postcards for free tobacco cigarettes are found in magazine ads from time to time. Children readily can fill out these cards and receive free cigarettes in the mail.

Studies indicate that raising the retail price of tobacco products reduces tobacco consumption by children.¹¹

The use of smokeless tobacco is rapidly increasing, mostly due to a growing demand by males age 13 to 16. The average age of first use is 10 years.¹² At the moment, smokeless tobacco remains free of any excise tax.

Cigarette vending machines are easily accessible to children.

5. Present statewide effort to combat tobacco use in children is insufficient:

Tobacco still is an entrenched part of our culture. Effective protective strategies require resources. Current public expenditures or programs aimed at discouraging initiation of tobacco use by children are miniscule. Private sector expenditures, while larger, are not substantial.

6. Encouraging leadership displayed by a variety of citizens and institutions in New Jersey:

There is a growing interest at a grassroots level to develop and implement innovative programs to prevent tobacco use by the young. Parents and teachers are working toward smoke-free environments for their children and students. It is believed that the testimony on November 19, 1986, indicates a change in public attitude which favors new public policy initiatives.

RECOMMENDATIONS

Based upon the findings presented, the Commis-

sion on Smoking of Health, makes the following recommendations:

• **1. Increase awareness and understanding of smoking as a major threat to the health of our children.**

(a) Incorporate tobacco education and prevention into drug education curricula. Along with the increased coverage of other substance abuse issues in school texts and curricula, tobacco and smoking should be addressed. The portion of the curriculum allotted should reflect its enormous importance relative to other drugs. Curriculum content should emphasize developing skills to resist pressures to smoke and the immediate adverse consequences of tobacco use.

(b) Education for health care professionals who are in direct contact with children should be undertaken. School nurses, counselors, family physicians, pediatricians, obstetricians, and dentists should be taught how to counsel a young patient to quit or to avoid tobacco use.

(c) Improve data collection on children and their tobacco use. The Commission was struck by the paucity of data on tobacco use by young people in New Jersey. The Department of Health should assist the Departments of Education and Law and Public Safety in expanding the coverage of smoking in the Drug and Alcohol use surveys of New Jersey high school students. Focused surveys should be undertaken by the Department of Health to answer specific questions of importance to program development and monitoring.

• **2. Counteract cultural and social influences that encourage tobacco use.**

(a) A vigorous media campaign promoting tobacco-free living should be promoted. Ridiculing tobacco advertising is one innovative approach. Role models appealing to youth, such as sports figures and rock stars might be utilized. Such a campaign would need to be large enough to effectively reduce the use of tobacco by young people.

(b) Persuade sport facilities to refuse tobacco-sponsored events. We believe telecasts of these events may circumvent the federal restrictions on radio and television cigarette advertising.

(c) Eliminate the marketing of candy or bubble gum cigarettes, cigars, pipes, and chewing tobacco in New Jersey. These products help teach children how to use tobacco products. Mock beer, wine or liquor packaged as facsimilies of real products would not be tolerated on the shelves of our stores. Imitation tobacco products should also not be allowed.

(d) Eliminate the marketing of toys and promotional items bearing tobacco trademarks. States have the legal authority to restrict the marketing of a wide array of consumer products. Products

How many cigarettes a day does your child smoke?

When a child breathes air filled with cigarette smoke
it can be as bad as if he actually smoked the cigarette himself.

targeted to very young children which accustom them to tobacco use are unacceptable.

(e) Designate all primary and secondary schools as tobacco-free. Physically separating smokers from nonsmokers within the same enclosed environment diminishes but does not eliminate the exposure of nonsmokers to environmental tobacco smoke.¹³ Allowing anyone to smoke at schools sends a mixed message to children. Allowing teachers to smoke at school reinforces the impression that smoking is an attractive, "adult" thing to do. A double standard is obvious to all when what is said about the drug nicotine and what the faculty is seen to do are inconsistent.

(f) Halt the sale and advertising of cigarettes on state properties and facilities. A state has the authority as a land owner to regulate commerce on its property. Public agencies should have no part in promoting products which are the leading cause of death and which have no socially redeeming value.

• **3. Restrict children's access to tobacco.**

(a) Ban the free distribution of tobacco products. Similar actions have already been taken in Minnesota, Boston, and Atlanta,¹⁴ and have not been challenged in court.

(b) Ban the sale and distribution of clove cigarettes. Some experts believe that clove cigarettes may be more toxic than conventional cigarettes. The major market for this product is children. New Mexico, Nevada, Indiana, and Florida have successfully banned their distribution.¹⁰

(c) Raise the age for legal sale and distribution of cigarettes to age 18 in New Jersey. Current law bans the sale of tobacco to minors 15 years of age and younger. A bill has passed the Assembly amending the law raising the age limit from 16 to 18, explicitly including smokeless tobacco, and raising the fine to \$250. The bill requires posting signs which summarize the law wherever cigarettes are sold or displayed.

Provisions should be added to the law which explicitly state that it is legal to use a minor to purchase tobacco for the purpose of monitoring compliance and enforcement. The penalty should include provision for the suspension and/or loss of license to sell tobacco products. This activity would be administered by the Department of Treasury.

(d) Raise the cigarette excise tax by 5 cents per pack of cigarettes. Tobacco consumption by adolescents experimenting with tobacco is price sensitive.¹¹ The Commission agrees with the observation that, in the narrow economic sense, excise taxes are regressive.¹¹ However, a higher excise tax is justified in light of the enormous societal cost and disease burden produced by smoking. The excise tax is one available tool to reduce tobacco use by children. "Buttlegging" to avoid the excise tax is of concern, but a tax increase of only 5 cents should not make too large an impact because of improved enforcement capabilities in recent years.¹⁵ This would generate an estimated \$40 million in revenue,¹⁶ part of

which could be used to implement recommendations.

(e) Tax smokeless tobacco at the same rate as cigarettes. A 25-cent per unit price rise will reduce consumption of these products by the children and teenagers. An estimated \$5 million might be raised by this tax.¹⁷

(f) Prohibit installation of cigarette vending machines in locations accessible to minors. The National Automatic Merchandising Association estimates that more than 20 percent of New Jersey's cigarette vending machines are in places easily accessible to children,¹⁸ representing approximately 5,000 machines. The Commission was shown no evidence that the vending industry's voluntary program to reduce sales of cigarettes to children has any effect. The only way to insure that vending operators obey the law forbidding the sales of tobacco products to minors is to regulate where such machines can be located or to eliminate them entirely.

(g) Educate tobacco retailers about the illegality of selling tobacco products to minors. Tobacco retailers need to be educated to the addictive nature of tobacco, and the true magnitude of the harm it causes, especially when tobacco use begins in early childhood. The Commission knows of no systematic effort to educate tobacco retailers about the importance of not selling tobacco products to minors. A program to educate tobacco retailers about tobacco and youth should be developed. A variety of methods could be employed: newsletters and trained volunteers visiting individuals and stores are two approaches which could be employed. The measure of success for this undertaking would be an improvement in the observance of the sale-to-minors law. ■

**Trustees' Minutes; UMDNJ
Notes; AMNJ Report;
Physicians Seeking
Location in New Jersey**

**Trustees' Minutes
December 20, 1987**

A regular meeting of the Board of Trustees was held on Sunday, December 20, 1987, at the Executive Offices in Lawrenceville. Detailed minutes are on file with the secretary of your county society. A summary of significant actions follows:

Report of the President . . . Noted that the task force on AIDS, which has been charged with recommending policy and providing continuing medical education on AIDS to New Jersey physicians, will meet on January 13, 1988.

Report of Executive Director . . .

(1) MSNJ Paid Membership . . . Noted that at this time paid 1987 memberships total 7,592.

(2) MSNJ Financial Statements . . . Approved the financial statements for the periods ending October 31, 1987, and November 30, 1987.

(3) AMA Advisors, Inc.—Committee on Membership Services . . . Was unanimously in favor of endorsement of AMA Advisors, Inc.; the program soon will be implemented.

(4) Tort Reform . . . Noted that bills on tort reform, structured payments, and statute of limitations reintroduced in the 1988 session of the legislature are expected soon.

(5) State Commission of Investigations (SCI) Report/Legislative Hearings . . . Noted that the Executive Committee agreed to retain Judge Herbert Stern to represent MSNJ in activity related to the SCI report and the impending legislative thrust.

(6) Blue Shield Contract Analysis . . . Will be advised when William P. Isele, Esq. completes a report on whether or not the interpretation of the participating physician agreement as related to Pace and Medallion programs is valid.

(7) General Liability Coverage to County Medical Societies . . . Noted that general liability coverage will be provided through MSNJ by endorsement to the existing general liability package.

(8) Optometric Drug Bill—S-2261 . . . Noted that S-2261, a bill which would grant optometrists the right to prescribe drugs, failed to receive the necessary votes.

(9) Physical Therapy Board Scope of Practice Rule . . . Noted that MSNJ will proceed with litigation, challenging the Physical Therapy Board regulation, without the assistance of the State Board.

(10) Preadmission Certification Programs/Utilization Review . . . Noted that the ultimate hope in this matter is that a system can be achieved whereby all preadmission certification and reviews are performed by the existing utilization review organizations.

UMDNJ Report . . .

(1) Resident Permits . . . Noted that UMDNJ is opposed to the rule proposal of the State Board of Medical Examiners on the issuance of resident permits, stating the paperwork would be overwhelming and would discourage good candidates from taking residencies in New Jersey.

(2) Resident Work Hours . . . Noted that recommendations have been made to the New York Commissioner of Health concerning limitations on resident work hours and parameters of supervision for residents in an educational setting.

(3) Foreign Medical Graduate Testing . . . Noted that the Educa-

tion Council for Foreign Medical Graduates has decided to proceed with clinical skills assessment as part of their examination.

NJ Hospital Association . . .

(1) Medical Waste Disposal . . . Noted a four-part program to address the problem of medical waste disposal consisting of: legislation; licensing of handlers; fines for improper disposal; and documentation system.

(2) AIDS . . . Noted that the NJHA Board of Trustees has appointed a special AIDS Task Force.

(3) Financial Crisis: New Jersey Hospitals . . . Unanimously approved the following recommendation:

That the Medical Society support a request to the Hospital Rate-Setting Commission, the Governor, and the Legislature to increase the base rate of reimbursement to hospitals in New Jersey with sufficient monies that the New Jersey Hospital Association data can support, to provide quality care for the citizens of New Jersey.

Approved the following recommendation:

That the President of the Medical Society of New Jersey write a letter to the Governor asking for his support in creating a committee for study of the crisis in the allied health technology fields.

Council on Legislation . . .

(1) Current State Legislation . . . Approved the following recommendation, with the exception of S-3498 and S-3633.

That the Board of Trustees approve the positions recommended by the Council on Legislation.

Noted that S-3498 creates a 15-member Commission to study services to patients with osteoporosis and changed position to "No Action." Noted that S-3633 requires health insurers to offer wellness incentives; changed position to "No Action."

Council on Mental Health . . . Adopted the following resolution:

That the Medical Society of New Jersey encourage the practice of consultation with a psychiatrist for evaluation, assessment, and recommendations before referring to nonmedical mental health professionals in the course of treating a patient with a mental illness.

Council on Public Health . . . Approved the following recommendation:

That the Medical Society of New Jersey sponsor an educational seminar for physicians on counseling related to HIV testing.

Also, approved the following three recommendations:

That the Medical Society of New Jersey endorse the concept of multidisciplinary consultation by diverse medical specialties such as surgery, medicine, radiation therapy, and pathology in the evaluation and management of cancer patients.

That the Medical Society of New Jersey endorse the American College of Surgeons approval program, including the multidisciplinary tumor board/conference and the hospital tumor registry.

That all hospitals be encouraged to participate in the program and seek full approval.

Committee on Membership Services . . . Approved the following recommendations:

That the Medical Society of New Jersey endorse the concept of the Peer Review Organization Legal Representation Program.

That the Medical Society of New Jersey endorse the Disability Income Protection Program offered by the Paul Revere Life

Insurance Company through the International Underwriters Agency.

That the Medical Society of New Jersey endorse the auto leasing program through Automotive Rentals, Inc.

That a professional printed informational folder containing all the endorsed programs offered by the Society be prepared and distributed to the membership.

Committee on Membership Services . . .

(1) Long-Term Nursing Care Insurance . . . Approved the following recommendation:

That the Medical Society of New Jersey endorse the individual long-term nursing care insurance available through Aetna and administered by Donald F. Smith & Associates.

(2) Blue Cross/Blue Shield, Major Medical and Dental Insurance Programs—Rate Increases . . .

(a) Blue Cross/Blue Shield . . . Noted that actual increases will vary by program and type of contract and therefore may be more or less than 25.34 percent.

(b) Major Medical . . . Noted that premium rates must be increased by an average of 34 percent, effective January 1, 1988.

(c) Dental . . . Noted that a refund of almost 25 percent of premiums

will be returned to participants, but noted that program costs in 1988 are projected to rise and a 9 percent increase will take effect January 1, 1988. Also, noted the Committee will review programs available through commercial insurers interested in underwriting the MSNJ group.

(3) Underwriting Changes in MSNJ Blue Cross/Blue Shield and Major Medical Insurance Programs . . . Changes in these programs appear on page 86.

Committee on Biomedical Ethics . . . Approved the following recommendations:

That representatives of the Citizens Committee on Biomedical Ethics, the New Jersey Hospital Association, and the Committee on Biomedical Ethics work together on a joint venture using the Pennsylvania Medical Society's "Do Not Resuscitate Guidelines."

That the composition of the Committee on Biomedical Ethics be expanded to include, as consultants, individuals who already have made biomedical decisions (i.e., the Commissioner of Health, decision judges, medical students, and representatives from the Citizen's Committee on Biomedical Ethics, and the New Jersey Hospital Association).

That a mechanism be developed to educate physicians on the policies created by the Committee on Biomedical Ethics and to follow up on their implementation.

That clinically oriented biomedical updates be featured in the newsletter or editorial sections of *NEW JERSEY MEDICINE*.

Special Committee on Emergency Medical Care . . . Approved the following recommendation:

That the Medical Society of New Jersey approve the report "New Jersey Emergency Medical Services Issues and Recommendations Phase I" and urge the state to implement the "911" emergency system as soon as possible.

Special Committee on Long-Range Planning and Development . . . Approved the following recommendation:

That prior to being interviewed by the Nominating Committee, candidates *may* submit a written statement as to why they believe they are qualified to represent the physicians of New Jersey in the office they are seeking; and also enclose their recent photograph. The material is to be included as part of the permanent records of the Nominating Committee and be available for examination by the nominating delegates at any time. (*Italics denote rewording.*)

Special Committee on Drugs and Alcohol Abuse . . . Approved the following recommendation:

That the Board of Trustees approve the Executive Summary Report of the Commission on Smoking or Health.

Committee on Medical Education . . . The following recommendation was approved.

That the Committee on Medical Education be authorized to meet with representatives of the State Board of Medical Examiners to discuss the proposed regulation on registration and permit requirements for graduate medical education programs.

Unfinished Business . . .

Task Force on AIDS . . . Noted that this Task Force will deal with the development of policies and protocol vis-a-vis physicians diagnosed as having AIDS, or found to have a positive HIV titer.

New Business . . .

State Board of Medical Examiners Policy on AIDS . . . Received the State Board's policy on AIDS.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D.
President

I would like to examine another aspect of our top 25 efforts: educational excellence. High-quality educational programs are the most basic element in the foundation required for a top-ranked health sciences university, and in recent years, excellence in minority education has developed as a strong corollary need. UMDNJ has achieved both, as demonstrated by the following statistics:

- Students at both of UMDNJ's allopathic medical schools have scored well above the national mean on national licensing examinations in each of the last seven years. The University's osteopathic school regularly ranks first or second in the nation in student performance on board examinations, while students of our dental school rank among the best in the Northeast region for the last five years.

- Students of the UMDNJ-School of Health Related Professions do equally well on their professional licensure tests. The University's Physicians Assistant program ranked first in the nation in 1986

for student performance, and has ranked among the top ten in every year since 1979. Nurse midwifery graduates averaged 560 on their certification examination against a passing national score of 375, and graduates of the Dietetic Internship program score well above the national mean.

- UMDNJ's two allopathic medical schools enroll 20.4 percent minority students as compared to an average of 8.65 percent in all United States medical schools, according to 1986 statistics from the American Association of Medical Colleges. While UMDNJ's students account for 3.75 percent of all medical students, the University enrolls 8.9 percent of all minority medical students in the nation.

- UMDNJ's residency training programs include 25 percent minority physicians as compared to 17 percent nationally. While UMDNJ trains 1.5 percent of the nation's medical residents, its programs account for 2.2 percent of all minority physicians in residencies.

- While national statistics reveal that only 80 percent of all medical school graduates were accepted in a matched residency program in their first year after graduation in 1986, 98 percent of the University's medical graduates received residencies; 88 percent of UMDNJ's minority graduates were placed.

UMDNJ has established itself as a national leader in the recruitment and retention of minority students, maintaining an enrollment of 20 percent minority students University-wide over the past 15 years. In addition, the University has pioneered in the development of enrichment programs designed to help disadvantaged students prepare for, and succeed in, medical and dental schools. Its nationally acclaimed Students for Medicine and Dentistry program has launched thousands of minority young people on professional careers in the health sciences at universities across the nation.

New Jersey needs a top-ranked health sciences university as an integral element in a world-class system of higher education. Much of the progress New Jersey has made over the past decade in advancing and improving its higher education system has been built upon linkages among programs and institutions, and UMDNJ has played a central role

in these initiatives. If higher education in New Jersey is to continue its development, a top 25 health sciences institution will be vital to its success. But most of all, a top ranked health sciences university will mean that New Jersey students will receive the highest quality health sciences education and that the state will have the highest caliber health professionals.

AMNJ Report

Anthony Minnefor, M.D.
President

The Academy is pleased to announce that we have expanded our relationship with the Healthcare Information Network (HIN) in Princeton. The "From the Academy" series will include on-site filming of procedures which will be incorporated into the studio interview format which has proved successful. We expect that this innovation significantly will enhance the interest in the programs. We are pleased that Dr. Joseph Lieberman will continue to act as moderator for the monthly series.

In addition, we have worked out an agreement with HIN to assist in the coordination of the MSNJ Professional Liability Forum. The Academy will provide mediated materials and an examination for each program which will insure meeting the criteria for category I credit.

The Second Annual Governor's Jersey Pride Awards Program will culminate on Thursday, January 7, 1988, with the presentation of 11 awards to distinguished New Jerseyans. The Governor's Award Ceremony will take place at 8:00 P.M. at Princeton's McCarter Theatre and an entertaining and inspirational evening is planned. The Academy is responsible for recommending nominees for the Clara Barton Medical Service Award. Award recipients will be announced in early December.

The Academy continues to provide a significant amount of continuing medical education programs for professionals involved with AIDS patients. A highlight of this effort will be a March 16, 1988, major symposium, "AIDS: The Physician and the Patient," to be cosponsored with MSNJ and the New Jersey State Department of Health. The program will examine counseling, ethical, and medicolegal issues and will include an AIDS patient on the agenda.

Further information will be forthcoming on this event.

The *New Jersey Physicians Golf Association* completed a successful inaugural year under the aegis of the Academy. Drs. Peter Tsairis and Steve Fletcher have been elected Chairman and Secretary, respectively, for the 1988 season. Plans are underway to hold six tournaments and a membership solicitation flyer was distributed with the Academy's Newsletter in December. Further information can be obtained by contacting Cal Heitzmann, Executive Director, at the Executive Offices.

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ANESTHESIOLOGY—Daniel O'Brien, M.D., 12 Beech Dr., Brunswick, ME 04011. Liege (Belgium) 1975. Board

certified. Group, partnership, solo. Available.

CARDIOLOGY—Richard Don Diego, M.D., 6020 Danny Kaye, #906, San Antonio, TX 78240. Central Caribbean (Puerto Rico) 1981. Also, internal medicine. Board eligible. Group or partnership. Available July 1988.
Govindaraju Subramani, M.D., 4250 N. Marine Dr., Apt. 506, Chicago, IL 60613. Wisconsin 1987. Board eligible. Partnership or group. Available.

FAMILY MEDICINE—William B. Glenn, D.O., 2 Raintree Way, Havelock, NC 28532. Philadelphia College 1980. Board certified. Group, partnership, solo. Available July 1988.
Chava Zimmerman, M.D., 127F Amberly Dr., Manalapan, NJ 07726. Wayne State 1978. Board certified. Group or HMO. Available July 1988.

GASTROENTEROLOGY—Joel H. Kurtz, M.D., 2600 Netherland Ave., Apt. 2811, Riverdale, NY 10463. UMDNJ 1983. Board eligible. Partnership or group. Available July 1988.

INTERNAL MEDICINE—Glenn A. Dubov, M.D., 75-36 Bell Blvd., Apt. 2A, Bayside, NY 11364. Chicago 1983. Board certified. Group or partnership. Available July 1988.
Kathy Rosen Kerr, M.D., 318 Perrine Ave., Piscataway, NJ 08854. UMDNJ

1984. Also, pediatrics. Board eligible. Partnership or small group. Available July 1988.

Daniel R. Massarelli, M.D., 98 Longfellow Rd., Worcester, MA 01602. Georgetown 1985. Board eligible. Group, partnership, solo. Available September 1988.

Sarva Daman Singh, M.D., 26 Carlson Ct., Closter, NJ 07624. Agra (India) 1978. Board eligible. Group or partnership. Available.

Samuel J. Stepanow, M.D., 430 W. Browning Rd., Apt. S-5, Bellmawr, NJ 08031. Hahnemann 1985. Board eligible. Group or partnership. Available July 1988.

Dariusz Sypek, M.D., 154 Oakwood Ave., Apt. 3, Cliffside Park, NJ 07019. Medical Academy (Poland) 1984. Board eligible. Group. Available July 1988.

NEPHROLOGY—Glenn A. Dubov, M.D., 75-36 Bell Blvd., Bayside, NY 11364. Chicago 1983. Also, internal medicine. Board certified (IM). Group or partnership. Available July 1988.

OPHTHALMOLOGY—James Scott Lewis, M.D., 531 Sprague Rd., Narberth, PA 19072. Jefferson 1982. Group, partnership, solo. Available.

PEDIATRICS—Sheth Amit, M.D., 1305 East 18 St., Brooklyn, NY 11230. N.H.L. Municipal (India) 1982. Board eligible. Group, partnership, solo. Available July 1988.
Kathy Rosen Kerr, M.D., 318 Perrine Ave., Piscataway, NJ 08854. UMDNJ 1984. Also, internal medicine. Board eligible. Partnership or small group. Available July 1988.

PULMONARY—Martin J. Greenberg, M.D., 76 Church St., Montclair, NJ 07042. Ross 1983. Board eligible. Partnership or group. Available July 1988.

RADIOLOGY—Charles Saniewski, M.D., 9261 E. Bay Harbor Dr., #8, Bay Harbor, FL 33154. Rome 1983. Board eligible. Group or partnership. Available July 1988.

SURGERY—Victor B. Lebedovych, M.D., 211 S. Crapo St., Mt. Pleasant, MI. Michigan 1968. Board certified. Partnership or association. Available.
Robert M. O'Brien, M.D., 182 Estates Dr., Piedmont, CA 94611. Vermont 1958. Also, noncardiac thoracic surgery. Board certified. Group, partnership, solo, in southern New Jersey only. Available.
Ramiro Requena, M.D., Interfaith Medical Center, 555 Prospect Place, Brooklyn, NY 11238. Bolivia 1966. Board certified. Group, partnership, solo. Available.

UROLOGY—Charles Dorfman, M.D., 3313 Amherst Rd., Erie, PA 16506. Universidad Central del Este (Mexico) 1980. Board eligible. Group or partnership. Available July 1988.

MEDICAL SOCIETY OF NEW JERSEY ANNUAL MEETING

Wednesday, April 27, 1988

3:30 p.m.—Board of Trustees' Meeting

Thursday, April 28, 1988

9:00 a.m.—Registration Opens

Sunday, May 1, 1988

8:00 a.m.—Registration Opens
8:00 a.m.—Message Center Opens
8:30 a.m.—Program on one topic of major interest to the physician
1:00 p.m.—Board of Trustees' Meeting

a turn for the better

New Jersey has eliminated one of the most costly inequities in our tort system... paying claimants twice for the same injury in many cases. Changing the "collateral source rule" has been a major priority of the Medical Inter-Insurance Exchange in its efforts to reform the medical malpractice legal system. The Exchange provided the initiative and leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. It will moderate the ever-increasing severity of insurance losses. A significant victory... but only one step in the Exchange's continuing battle to relieve physicians of unfair burdens.

*The University of Pennsylvania School of Medicine is accredited by the Accreditation Council for Continuing Medical Education to sponsor continuing education for physicians. The University of Pennsylvania School of Medicine designates this continuing medical activity for 2 credit hours per session in Category 1 of the Physician's Recognition Award of the American Medical Association.

CME CALENDAR

The following is a list of continuing medical education courses for the next two months. Contact the sponsoring organization for further information.

ANESTHESIOLOGY

March

- 2 Does Choice of Anesthetic Make a Difference?**
8-8:50 A.M.—Robert Wood Johnson Medical School, MEB-593, New Brunswick (UMDNJ)
- 12- 29th Annual Postgraduate**
- 13 Anesthesia Seminar**
Hyatt Hotel, Cherry Hill (New Jersey State Society of Anesthesiologists)

CARDIOLOGY

March

- 1 Advanced Cardiac Life-Support**
- 3 Provider Course**
28 New Jersey Medical School, MSB,
- 29 B-648, Newark**
- 31 (UMDNJ)**
- 3 Cardiology Grand Rounds**
10 12 noon—Robert Wood Johnson
- 17 Medical School, Academic**
- 24 Health Science Center,**
New Brunswick (UMDNJ)
- 17 New Approaches to the Management of Heart Failure**
5 P.M.—Fuld Auditorium, Somerset Medical Center, Somerville (Somerset Medical Center)

DERMATOLOGY

March

- 2 Common Problems in Dermatology**
1:30-2:30 P.M.—Health Maintenance Organization, New Brunswick (Rutgers Community Health Plan)
- 8 Dermatology Lecture**
8-10 P.M.—Schering Corporation, Kenilworth (The Dermatological Society of New Jersey)

- 16 Dermatology-I**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 23 Dermatology-II**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 30 Common Skin Disorders**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)

April

- 12 Dermatology Lecture**
8-10 P.M.—Schering Corporation—Kenilworth (The Dermatology Society of New Jersey)
- 20 Dermatology Conference**
6-9 P.M.—Rutgers Community Health Plan, New Brunswick (UMDNJ)

MEDICINE

March

- 2 Drug Addiction: Chronic Pain Management and Other Issues**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (St. Mary's Hospital)
- 2 Drug Interactions**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 3 Disease Associated with Exposure to Asbestos**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 4 Alzheimer's Disease**
12 noon-1 P.M.—Bridgeton General Hospital, Bridgeton (AMNJ)
- 5 Endocrine Series**
11:30 A.M.-1 P.M.—VA Medical Center, East Orange (AMNJ)
- 7 Rheumatology Staff Conference**
5:30-7 P.M.—Robert Wood Johnson Medical School, MEB-393, New Brunswick (UMDNJ)
- 8 Laser Treatment of GI Hemorrhage**
12 noon-1 P.M.—Hospital Center at Orange (AMNJ)
- 8 Grand Rounds**
15 9-10 A.M.—Holy Name Hospital,
- 22 Marian Hall, Teaneck**
- 29 (Holy Name Hospital)**
- 9 Medical Grand Rounds**
16 10 A.M.—St. Mary Hospital,
- 23 Hoboken**
(St. Mary Hospital)
- 9 Management of Abdominal Emergencies**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (St. Mary's Hospital)
- 9 Alzheimer's Disease**
1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (AMNJ)
- 10 Scientific Meeting**
7:30-9:30 P.M.—Saint Barnabas Medical Center, Livingston

(New Jersey Institute of Ultrasound in Medicine)

- 14 Medical Aspects of Alcohol Abuse**
2-3 P.M.—Forensic Psychiatric Hospital, Trenton (Forensic Psychiatric Hospital)
- 15 Anion Gaps—Urine, Blood, and Stool**
4-5 P.M.—Robert Wood Johnson Medical School, New Brunswick (UMDNJ)
- 16 Nephrotoxicity of Common Drugs**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (AMNJ)
- 16 Use of Second Generation Oral Agents**
10:30-11:30 A.M.—Christ Hospital, Jersey City (Christ Hospital)
- 16 Ramifications and Implications of the New Jersey Controlled Dangerous Substance Act**
8:30 P.M.—Passaic County Medical Society, Clifton (Passaic County Medical Society)
- 17 Indoor Air Pollution: Public Health Perspective**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 17 Physical Assessment of Severely Disabled**
1:30-2:30 P.M.—Vineland Developmental Center Hospital (AMNJ)
- 17- 36th Annual Convention:**
- 20 Family Practice**
Bally's Park Casino Hotel, Atlantic City
- 17 American Academy of Allergy and Immunology**
11 A.M.—Children's Hospital, Newark (UMDNJ)
- 18 Gastroenterology—Peptic Ulcer**
10:30-11:30 A.M.—Woodbridge Developmental Center (AMNJ)
- 24 Radon: Consequences of Human Exposure**
4-6 P.M.—Coriell Institute, Camden (Coriell Institute)
- 24 Proper Use of Antibiotics**
1:30-2:30 P.M.—Hunterdon Developmental Center, Clinton (AMNJ)
- 24 Visiting Professor Program**
1:30-2:30 P.M.—Saint Barnabas Medical Center, Livingston (Saint Barnabas Medical Center)

April

- 2 Endocrine Series**
11:30 A.M.-1 P.M.—VA Medical Center, East Orange (AMNJ)
- 4 Rheumatology Staff Conference**
5:30-7 P.M.—Robert Wood Johnson Medical School, MEB-393, New Brunswick (UMDNJ)
- 6 The Otto Brandman M.D. Award Ceremony**
6-11 P.M.—The Hyatt Regency, New Brunswick (American Diabetes Association)

ANNUAL CME ASSEMBLY

presented by the

MEDICAL SOCIETY OF THE STATE OF NEW YORK

New Approaches to Habit Abuse and Dependency

APRIL 22-24, 1988

THE NEW YORK HILTON, NEW YORK CITY

HIGHLIGHTS . . .

25 CME Sessions; Panel Discussions; 80 Technical Exhibits; two Receptions; President's Dinner Dance.

Registration: There is a \$25. fee for members of the New Jersey State Medical Society; no fee for residents, medical students, or medical assistants. Non-member physicians—\$50; Allied Professions \$10. We are accredited by the Accreditation Council for CME.

For a copy of the preliminary program, contact: MSSNY, 420 Lakeville Road, P.O. Box 5404, Lake Success, N.Y. 11042.

The Psycho/Social, Ethical
& Medicolegal Issues
in the Treatment of HIV
Seropositive, ARC & AIDS
Patients**

on

Wednesday, March 16, 1988

at

**Rider College
Student Center**

Lawrenceville, New Jersey

There are approximately 3,250 reported AIDS cases in New Jersey, a number which is expected to increase five fold by 1991. It is estimated that for every case of AIDS, there are 10 times as many ARC patients and 100 times as many individuals infected with HIV. This seminar is designed to focus on those issues which will confront all physicians and health care personnel now and in the immediate future regarding the delivery of quality health care for those infected.

Let's Talk Finance

Establishing and maintaining a successful medical practice requires more of you than your skill and expertise as a physician—it calls for a thorough understanding of your financial needs and alternatives. Whether you are starting out in practice, expanding, or preparing to buy or lease medical equipment, you need to know how and where to find the necessary financing.

Medical Practice Finance: A Guide for Physicians is a new resource from the AMA specifically designed for medical practices.

Prepared in cooperation with Arthur Young & Co., this primer reviews sources of financing, the advantages and disadvantages of various alternatives, and the steps involved in obtaining financing. It also presents you with case studies, sample practice plans and loan applications, and a listing of sources for additional information.

*Let **Medical Practice Finance: A Guide for Physicians** help you acquire the resources you need to provide the best possible care for your patients. Complete the coupon to order your copy today.*

**Executive Director
Emeritus Richard I. Nevin,
Sr.; Drs. Ellis; Fabian;
Levine; Persico**

Dr. Allan S. Ellis

Pathologist Allan Sigismund Ellis, M.D., of New Milford, died on October 24, 1987, at the age of 67. Born in Jamaica, Dr. Ellis attended Meharry Medical College, Nashville, Tennessee, where he received his medical degree in 1951. From 1956 to 1960, he maintained a private practice in Port Leyden, New York, after serving his internship and residency. He was on the staffs of several hospitals, including Wayne General Hospital, where he became chief of pathology and director of laboratory services. Dr. Ellis was a member of our Passaic County component, of the American Medical Association, and of the American College of Clinical Pathologists.

Dr. Paul L. Fabian

A private family practitioner in Trenton for over 45 years, Paul Louis Fabian, M.D., died at the age of 88 on November 28, 1987, at his home in Yardley, Pennsylvania. Born in Shenandoah, Pennsylvania, Dr. Fabian received his medical degree from Hahnemann Medical College, Philadelphia, in 1929, and interned at McKinley Hospital (now known as Helene Fuld Medical Center) in Trenton, later joining its medical staff. Dr. Fabian maintained a private practice on Princeton Avenue, and later at Helene Fuld Medical Arts Building until 1982. In 1964, he was awarded the Helene Fuld Medical Staff Silver Anniversary Award, and was selected Doctor of the Year by the Private Duty Nurses Associa-

tion. Dr. Fabian received MSNJ's Golden Merit Award and Hahnemann Medical College and Hospital's Award for 50 years of distinguished medical practice, in 1979. He was a member of our Mercer County component and of the American Medical Association.

Dr. Philip Levine

The significant contributor to the discovery of the Rh factor, retired hematologist Philip Levine, M.D., passed away on October 18, 1987, at the age of 87, after over 50 years in immunogenetics research and consulting. A native of Russia, Dr. Levine was graduated from Cornell University Medical College, New York, in 1923. He became Director of the Biologic Division at Ortho Research Foundation and was a consultant, specializing in Rh compatibility problems. Dr. Levine served as a visiting investigator at Sloan-Kettering Institute for Cancer Research, New York. He was the recipient of many awards, including: the Mead-Johnson Award (1943), the Lasher Award (1946), the Ward-Burdick Award (1946), the Passano Foundation Award (1958), as well as the MSNJ Golden Merit Award (1973). A Fellow of both the American and Royal Colleges of Physicians, Dr. Levine was a member of our Union County component.

Richard I. Nevin, Sr.

Richard I. Nevin, Sr., Executive Director Emeritus of MSNJ, died on October 28, 1987, at his home in Yardley, Pennsylvania. Born in Jersey City in 1908, he attended Fordham University, New York, where he received his undergraduate degree in premedical studies in 1930. He excelled in both the sciences and the humanities, writing for many university publications and authoring and producing collegiate one-act plays. Aspiring to a career in medicine, he pursued a medical degree for two years at the Long Island College of Medicine, until circumstances brought on by the Depression prohibited him from finishing. In 1931, he became a faculty member of Saint Peter's College, Jersey City, teaching English and speech for the next 20 years. While teaching, Mr. Nevin continued graduate studies in English and speech at Columbia and Fordham Universities. He became the head of the speech

department, and established the College's Bureaus of Public Relations and Placement, becoming the first director of both. Mr. Nevin became coordinator of the postgraduate program in medical studies at Saint Peter's, and because of his growing reputation as a gifted teacher and guest speaker, he was called on to give many courses in speech training to professional groups, including physicians. In 1950, Mr. Nevin was invited to deliver the Elias J. Marsh Oration at the Fall Clinical Conference of the Medical Society of New Jersey, and a year later, he was selected as the Medical Society's Executive Director, serving in that capacity until his retirement in 1973. During the Medical Society's bicentennial year, 1966, Mr. Nevin was elected an honorary member of the Society, and in honor of his many years of assisting and furthering the aim of organized medicine in New Jersey and in national medical affairs, the House of Delegates conferred upon him the life-long title of Executive Director Emeritus, at the 207th Annual Meeting in 1973. Mr. Nevin was a friend, mentor, and advocate for thousands of New Jersey physicians. His distinguished service to this Society is deeply appreciated by his many friends and co-workers.

Dr. Anthony J. Persico

A specialist in orthopedic medicine, Anthony Joseph Persico, M.D., died on October 26, 1987, at the age of 73. A native of New York City, Dr. Persico received his medical degree from Long Island College of Medicine, New York, in 1939. He was a staff surgeon at Bellevue Hospital, New York, from 1951 to 1961, and became affiliated with Holy Name Hospital, Teaneck, where he served as president of the medical staff and chief of the orthopedic service from 1972 to 1975. Since 1954, Dr. Persico operated a private practice in Teaneck. During World War II, he attained the rank of first lieutenant in the medical corps of the United States Army. Dr. Persico was a Diplomate in orthopedic surgery, and a Fellow of the American College of Surgeons; he was a member of our Bergen County component, of the American Medical Association, of the Academy of Orthopedic Surgeons, and of the New Jersey Orthopedic Society.

AUTHOR INFORMATION

New Jersey Medicine is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in New Jersey Medicine is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

TELL YOUR PATIENTS THEIR CHOLESTEROL NUMBER... BEFORE THEY ASK.

Reducing high blood cholesterol reduces the risk of heart disease. That's why we're telling Americans—through a national public service advertising campaign—to know their cholesterol number. Your patients may soon be asking you for their number and what it means.

And when they do, we can help. The National Cholesterol Education Program, administered by the National Heart, Lung, and Blood Institute, has developed adult treatment guidelines to help you identify high-risk patients and use the appropriate diet and/or drug therapy for those with elevated cholesterol levels.

Help your patients reduce their risk of heart disease. For a free copy of the *Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults*, complete the form below.

ORTHOPAEDIC SURGEON

A highly successful multi-specialty group with three orthopaedic surgeons is searching for a fourth orthopaedist. All types of general orthopaedic problems are treated; however, due to the significant volume of back injury cases we encounter, an interest in spinal injuries is important. The income potential for an ambitious orthopaedic surgeon is excellent. The practice is located in a growing Mid-Atlantic state only twenty miles from a beach resort area. Baltimore and Philadelphia are also within close proximity. If you are interested, please submit your curriculum vitae and references to Mr. J. Stokes, P.O. Box 19, Milford, DE 19963.

Health Care Personnel Consulting, Inc.

a division of The Health Care Group

specializes in valuation and sales. We have practices currently available in the following specialty areas:

**DENTAL, DERMATOLOGY, FAMILY PRACTICE,
INTERNAL MEDICINE, OPHTHALMOLOGY**

(201) 449-0022

Specify
Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows:

“Possibly” effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl/Roche) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur.

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

"Do Not Substitute."

When brain and bowel conflict...

It's time for the Peacemaker.

In irritable bowel syndrome* anxiety can aggravate intestinal symptoms, which may further intensify anxiety — a distressing cycle of brain/bowel conflict. Librax intervenes with two well-known compounds. The Librium® (chlordiazepoxide HCl/Roche) component safely relieves anxiety. And Quarzan® (clidinium bromide/Roche) provides antisecretory and antispasmodic action to relieve discomfort associated with intestinal hypermotility.

Dual action — for peace between brain and bowel. Because of possible CNS effects, caution patients about engaging in activities requiring complete mental alertness. Specify Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl
and 2.5 mg clidinium bromide

*Librax has been evaluated as possibly effective as adjunctive therapy in the treatment of peptic ulcer and the irritable bowel syndrome.

All programs are underwritten by Nationwide Life Insurance Company except Term Life which is by Nationwide, Principal, and Occidental; Professional Overhead Expense which is by National Casualty Company (A Nationwide Company); and the Keogh Plans which are by Prudential and Nationwide.

A better alternative for hypertensives who are going bananas...

DYAZIDE
SKF

Spare your patients the extra cost—
in calories, sodium and dollars.

Spare your patients the rigors of
dietary K⁺ supplementation.

DYAZIDE[®]

25mg Hydrochlorothiazide/50mg Triamterene/SKF

Effective antihypertensive* therapy...without the bananas

DAW

'DYAZIDE' AS WRITTEN.

* Not for initial therapy. See brief summary.

Before prescribing, see complete
prescribing information in
SK&F CO. literature or PDR.
The following is a brief summary.

WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or

without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin[ACTH]). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The

following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity; purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, stomatitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak™ unit-of-use bottles of 100.

**Kidney stones show up in
some hard-to-reach places.**

**Luckily, the New Jersey
Kidney Stone
Treatment Center
is easy to get to.**

You shouldn't have to go out of your way for lithotripsy services to complement your practice.

The New Jersey Kidney Stone Treatment Center is centrally located in New Brunswick, New Jersey, near statewide highways, for easy access for you and your patients.

The Center is equipped with the latest Dornier HM4 "tubless" lithotripter, which eliminates the need for a water bath. That means easier patient handling, and greater patient comfort.

And the Center is located at a major academic medical center, with full medical back-up. Patients are treated on an outpatient or inpatient basis.

Any board-eligible or board-certified urologist who has completed the ESWL training course and is licensed in the State of New Jersey may apply for privileges at the Center.

Physicians may also refer their patients to the Center for treatment by a member of our medical staff. After the procedure, patients are referred back to their own urologists for follow-up care.

For a credentialing package, or for more information about lithotripsy, call Center Director Diane DiGiulio at 1-800-542-8887, 8 a.m.-5 p.m., Monday-Friday.

New Jersey Kidney Stone Treatment Center

Located at Robert Wood Johnson University Hospital
One Robert Wood Johnson Place
New Brunswick, New Jersey 08901

The New Jersey Kidney Stone Treatment Center is operated by Health Horizons, (ESWL), L.P., affiliated with the following hospitals: Community Memorial Hospital, Freehold Area Hospital, Helene Fuld Medical Center, Jersey Shore Medical Center, Raritan Bay Medical Center, Riverview Medical Center, Robert Wood Johnson University Hospital, St. Francis Medical Center, St. Peter's Medical Center, Somerset Medical Center.

YOCON®

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is the drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

LIBRIUM®

chlordiazepoxide HCl/Roche (N)

5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido — all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. **Oral — Adults:** Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. **Geriatric patients:** 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg — bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cards of 25, and in boxes containing 10 strips of 10. Libritabs® (chlordiazepoxide/Roche) tablets, 5 mg and 10 mg — bottles of 100 and 500; 25 mg — bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

Do not substitute

Librium®

brand of

chlordiazepoxide HCl/Roche®

Nobody does it better.

First hundreds...

Then thousands...

Soon more than a million.

Soon more than a million insulin users will be taking Humulin.

And no wonder. Humulin is identical to the insulin produced by the human pancreas—except that it is made by rDNA technology.

Humulin is not derived from animal pancreases. So it contains none of the animal-source pancreatic impurities that may contribute to insulin allergies or immunogenicity.

The clinical significance of insulin antibodies in the complications of diabetes is uncertain at this time. However, high antibody titers have been shown to decrease the small amounts of endogenous insulin secretion some insulin users still have. The lower immunogenicity of Humulin has been shown to result in lower insulin antibody titers; thus, Humulin may help to prolong endogenous insulin production in some patients.

Any change of insulin should be made cautiously and only under medical supervision. Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente®, etc), species/source (beef, pork, beef-pork, or human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

THE MEDICAL SOCIETY OF NEW JERSEY

VOLUME 52

HEALTHSTART

HealthStart is a major, new state initiative to improve the accessibility and scope of maternal and child health services available in New Jersey to all Medicaid pregnant women and children under the age of two. The program started in February 1988.

HealthStart is a joint program of the Department of Human Services and Department of Health. All HealthStart providers must be Medicaid providers; however, not all Medicaid providers will be HealthStart providers. All HealthStart providers will be required to hold a Certificate, issued by the Department of Health, verifying the provider's ability to deliver the required, comprehensive HealthStart services.

The major features of HealthStart are: an enriched package of maternity and preventive pediatric services for Medicaid pregnant women and children under the age of two; major consumer outreach efforts at the state and community level; increased reimbursement to providers; continuing education services for providers; and ongoing quality assurance and outcome measure activities.

Clients who are receiving HealthStart services are entitled to receive the full range of Medicaid services.

Who is eligible for HealthStart: all Medicaid eligible pregnant women including those pregnant women determined presumptively eligible; and all Medicaid children under two years of age.

HealthStart Maternity Care. *Eligible Providers:* The following Medicaid providers are eligible to apply for a HealthStart Maternity Care Certificate: ambulatory care centers, including independent clinics and hospital-affiliated clinics; physicians and physician groups; certified nurse midwives. Applications for Maternity Care Certificates are available from HealthStart, New Jersey Department of Health.

Comprehensive Services: The comprehensive service package has two major components: medical services and health support services. Both the medical care and health support services are expected to be provided at one contiguous site. Private practitioners are permitted to use two sites if the delivery of comprehensive services is not feasible at one site. HealthStart Providers are encouraged to directly provide both components of the enriched service package but are permitted to make an arrangement with another HealthStart maternity care provider for the delivery of medical services or health support services. Service agreements must specify which provider is assuming

primary care coordination responsibility for the patient.

HealthStart medical services include prenatal visits, intrapartum care, and postpartum visits as recommended by the American College of Obstetricians and Gynecologists.

Health Support Services include case coordination and followup services, social/psychological assessment guidance and counseling, nutrition assessment, guidance and counseling, home visitation, health education instruction, and referral to and followup with other community-based service providers.

Pediatric Care. *Eligible Providers:* The following Medicaid providers are eligible to apply for a HealthStart Pediatric Care Certificate: ambulatory care centers, including independent clinics and hospital affiliated clinics; physicians and physician groups. Applications for Pediatric Care Certificates are available from the New Jersey Department of Health.

Comprehensive Services: HealthStart Pediatric services are designed to assure that each child receives coordinated preventive health care and sick care.

All HealthStart providers who are eligible to provide Early Periodic Screening, Diagnosis and Treatment (EPSDT) services are required to provide such services.

Pediatric services include: nine preventive child health visits in accordance with the standards of the American Academy of Pediatrics; immunizations; outreach and followup for missed appointments; provision or arrangement for sick care and 24-hour telephone coverage; and appropriate follow-up.

MSNJ ANNUAL MEETING

The 222nd Annual Meeting of the Medical Society of New Jersey will open on Thursday, April 28, 1988, at the Sheraton Meadowlands Hotel in East Rutherford.

Registration for the Annual Meeting begins at 9 A.M. on Thursday and at 8 A.M. for the next three days. In addition to the Message Center which is in operation throughout the Annual Meeting, there will be an exhibit hall open to registrants and guests.

The House of Delegates commences on Thursday at 2 P.M.; elections are held on Friday, April 29, 1988, at 9 A.M. Also, on Friday is the Golden Merit Award ceremony honoring physicians who have been in practice for 50 years in New Jersey. After Reference Committee meetings in the afternoon, JEMPAC, the state medical political action committee, will host a political forum

PRESIDENT'S HOTLINE: HARRY M. CARNES, M.D.

★ **Malpractice Surcharge Opposed.** The Society has advised Commissioner Merin of the State Department of Insurance that it is opposed to his plan to levy an across-the-board surcharge on all currently insured physicians to finance a deficit of \$60 million. The deficit relates to the Malpractice Reinsurance Association, activated by Commissioner Sheeran in 1977 and operated through 1982. The Board maintains that only those physicians who were insured through that entity should be surcharged to fund the deficit that their experience created. Legal action will be instituted by the Medical Inter-Insurance Exchange and the Society if the Commissioner pursues his "across-the-board" plan.

★ **AIDS Task Force.** The AIDS Task Force met on January 27, 1988, to recommend testing policy to MSNJ and give guidance to our legislative stance on various bills that have been introduced. A statewide AIDS educational program will be announced shortly in conjunction with the Academy of Medicine of New Jersey. The Task Force will develop a program for our Annual Meeting, to be presented on Sunday, May 1, 1988.

★ **Membership.** Medicine faces some of its most difficult struggles in the next several years. Doctor "bashers" are everywhere. We must consolidate. We must maximize our potential. Every member should seek to recruit one new member per year.

at 5 P.M. and a wine and cheese reception at 5:45 P.M.

The House of Delegates holds two sessions on Saturday, and the day closes with the inaugural reception and dinner honoring Palma Formica, M.D.

One Sunday, May 1, 1988, at 8:30 A.M., there will be a educational program on an topic of major interest to all physicians.

Your attendance at the Annual Meeting will ensure an active Medical Society. For further information, please call MSNJ Headquarters at 609/896-1766.

NOTIFICATION OF DUES NONDEDUCTIBILITY

The recently enacted tax legislation requires all exempt organizations, other than those exempt under Section 501(c)(3) of the Internal Revenue Code, to include in "each fundraising solicitation" made after January 31, 1988, "an express statement (in a conspicuous and easily recognizable format) that contributions or gifts to such organizations are not deductible as charitable contributions for federal income tax purposes." This requirement is applicable to all solicitations in written form, by television or radio, or by telephone. The only statutory exceptions are for small organizations whose gross receipts are normally not more than \$100,000 per year and a solicitation by letter or telephone which is "not part of a coordinated fundraising campaign soliciting more than 10 persons during the calendar year."

Failure to comply with this requirement can result in severe penalties. In general, failure to comply will result in a penalty of \$1,000 for each day on which the failure to comply occurred, to a maximum of \$10,000 a year for each organization. This penalty is not imposed if the failure to comply was due to "reasonable cause." What constitutes reasonable cause for not complying is not clear. If, however, the failure is due to an intentional disregard of the requirement, the \$10,000 maximum does not apply and the penalty for each day is the greater of \$1,000 or 50 percent of the cost of the solicitations made on that day. For purposes of these penalties, the failure to comply is deemed to occur only on days the solicitation is actually made, e.g., when a solicitation is mailed or phone calls are made.

In order to comply with this requirement, it will be necessary to include a statement regarding nondeductibility on all solicitations for medical association dues and PAC contributions. The following wording

has been suggested: Contributions to AMPAC and State PAC are not deductible as charitable contributions for federal income tax purposes.

Due to the immediacy of this provision, it is imperative that this be done as quickly as possible to avoid any monetary penalties.

PSYCHIATRIC REFERRAL/RESOLUTION

The following resolution was adopted by the Board of Trustees at its December 1987 meeting:

Resolved, that the Medical Society of New Jersey encourages its members to consult with a psychiatrist for patient evaluation, assessment, and recommendations before referring such patients to nonmedical mental health professionals for the treatment of mental illness.

SPECIAL COUNSEL TO MSNJ

Herbert J. Stern, who won national recognition as United States District Court Judge and as United States Attorney for New Jersey, will serve as special counsel to the Medical Society of New Jersey to review procedures for identifying and treating impaired physicians while protecting the public.

"The State Commission of Investigation (SCI) has raised serious questions about New Jersey law governing physicians and other health care providers and about procedures of the Board of Medical Examiners," said MSNJ President Harry M. Carnes, M.D. "Left unanswered, the report could undermine the public's confidence in their physicians and other health care professionals. We agree that existing laws and regulatory procedures can be improved. Such improvements must be based on a full airing of the facts. We're delighted that Judge Stern will work with us, the legislature, and the SCI in developing such an exposition of the facts."

"We intend to work in a constructive way with the Legislature, the SCI, and the Board of Medical Examiners," Stern said. "The Medical Society's procedures for treating impaired physicians and reporting to the authorities those who are incompetent to practice medicine are recognized as the national model for the protection of the public. While there's always room for improvement, we want to assure that the benefits of MSNJ's widely recognized program are not needlessly lost."

LEGISLATIVE AND REGULATORY NOTES

1. Congress and the Administration Reach Economic Agreement. Following a month of intense and divisive negotiations, congressional leaders and President Reagan concluded the "other" Washington summit by announcing agreement on the outlines of a spending and tax package. This package, designed to provide for two years of deficit reduction, would putatively reduce the deficit by \$76 billion over two years. The agreement specifically provides for \$30 billion in reductions for fiscal year 1988 and \$45.5 billion for fiscal year 1989. However, the plan provides only a broad sketch of the necessary combination of

spending reductions and revenue increases needed to meet the outlined goals. Indeed, as part of the agreement, the Senate must pass a reconciliation bill following the return of Congress from its Thanksgiving recess. Following this action, conferees will be appointed from both the House and Senate to negotiate a compromise agreement. Any such agreement would then be wrapped up either as part of or to accompany the Continuing Resolution for appropriated funds needed for the remainder of fiscal year 1988. The current resolution providing for government operations expired December 16, 1987. Under the "summit" agreement, the Medicare program would absorb cuts from current policy of \$2.0 billion in fiscal year 1988 and \$3.5 billion

in fiscal year 1989. It is likely the additional cuts from Medicare will build on the \$1.5 billion in reductions previously identified in the congressional budget resolution and provided for under the reconciliation bill passed by the House in September 1987. Congressional sources indicate that the additional Medicare reductions could come from cuts of up to \$125 million from physician providers, \$180 million from hospitals, \$180 million from laboratory fees, and the balance from reductions in payments for durable medical equipment. Reliable sources indicate that the most politically feasible source for reductions in physicians' payments would be through a partial or total freeze on the physician update under Part B. As part of such a freeze, beneficiary "protections" through modifications to the MAAC (maximum allowable actual costs) program could be employed. It is not yet clear how agreed-upon reductions for fiscal year 1989 would be guaranteed and enforced. While the architects of the congressional-administrative "summit" agreement are optimistic as to its prospects, other sources indicate that final agreement on any such passage is questionable. Many congressional Republicans and conservative Democrats may be willing to rely on the existing \$23 billion in Gramm/Rudman/Hollings automatic reductions instead. For these members, the Gramm-Rudman cuts are real. (For Medicare, this would mean a 2.34 percent reduction in reimbursements.) Since the so-called "sequester" already has taken place, Congress may give up the effort to flesh out the skeleton of the agreement reached by the month-long "summit."

2. AMA Concerns Lead To Changes in MAAC Monitoring. The Health Care Financing Administration (HCFA) has made important modifications in the MAAC monitoring process in response to AMA concerns about past problems in implementing the MAAC limits. HCFA delayed issuing violation notices to be sure that carriers properly carried out their instructions. AMA objected that too little time was to be given to physicians to adjust their charges in cases of alleged violations. Consequently, except in extreme situations, physicians will not be referred to the Inspector General for sanctions if they reduce their charges to a level at or below the MAAC limit. In addition, HCFA raised the cumulative threshold to trigger a violation notice from \$500 to \$700. For example, if a charge is \$50 above the MAAC limit and the service is provided 14 times, a violation notice would be issued. In cases where physicians received inaccurate MAAC data from the carrier, monitoring is to begin after the date of the corrected or recalculated MAAC. Even with the above modifications, approximately 5 percent of non-participating physicians nationwide are expected to receive MAAC warning letters. Physicians should immediately respond, in writing, if a potential violation notice is received. If the local Medicare carrier fails to respond to your inquiry, promptly contact the Regional HCFA Office.

3. Washington Legislative Summary.

Clearinghouse. Concerted AMA lobbying on both the federal and congressional fronts achieved a major victory with House and Senate passage of S. 1158. This bill includes provisions absolutely essential to physicians. It would effectively amend the Health Care Quality Improvement Act of 1986 to eliminate broad access

by malpractice attorneys to physician data bank information. The bill now goes for signature to President Reagan who opposed the bill by waging a final all-out attempt to defeat the measure.

Drug Dispensing. The strength of AMA contacts both in Washington and from the Federation has kept the Wyden prescription drug dispensing bill from reaching the House floor. The bill now appears dead for the remainder of this congressional session.

Tobacco. Building on AMA focus on the ill-health consequences of tobacco smoking, both the House and Senate are in conference on a bill that would ban smoking on most domestic airline flights. AMA continues to keep up the pressure on this key health issue and appears headed for a major "win."

Professional Liability Insurance. AMA-sponsored bills to resolve the medical malpractice insurance crisis continue to serve as the focal point for congressional debate. In discussions with the major congressional players in this area, AMA input and support is viewed as critical to moving the legislation. AMA will continue seeking a workable federal solution in this area through its leadership role.

Catastrophic Medicare Coverage. Both the House and Senate have passed bills to protect the nation's elderly from catastrophic medical expenses. Through persistent AMA efforts, the Senate version explicitly prohibits a drug formulary. AMA will redouble its efforts with House and Senate conferees to ensure that no formulary or similar provision is added.

UBIT. Although the House-passed reconciliation bill contains a provision that would tax the investment income of 501(c)(6) professional and trade associations, AMA continues its efforts to keep the provision from becoming law. In a recent letter to Senate Finance Committee Chairman Bentsen, over 20 Senators joined in opposing the provision. With the help of the Federation, we hope to stop the UBIT provision from being enacted into law.

PROs. Thanks in large measure to the unyielding demands of the AMA, the House and the Senate Finance Committee passed reconciliation bills containing language essential to physicians involved in peer review. Chief among the victories on this front was significant added due process protection for physicians. AMA will continue the fight to retain these provisions in the budget summit reconciliation process.

MEDICARE BUDGET RECONCILIATION

A. Provisions Relating To Medicare Part B.

1. Physician Reimbursement Update. The 2.34 percent reduction in reimbursement for services provided on or after November 21, 1987, under Gramm-Rudman sequestration will continue for services provided through March 31, 1988, for all physicians regardless of participation status.

Beginning April 1, there will be four different levels of reimbursement increases depending on the physician's participation status and the type of service. For participating physicians, there will be a 3.6 percent increase for primary care services and a 1 percent increase for nonprimary care services. For nonparticipating physicians, there will be a 3.1 percent increase for primary care services and a 0.5 percent increase for

nonprimary care services. There will be incentive payments for primary care services furnished by physicians in rural areas or in a health manpower shortage area.

2. *Inherent Reasonableness.* Reimbursement for 15 procedures will be reduced by 2 percent nationwide (though no level of reimbursement will be allowed to drop below 85 percent of the national average) beginning April 1, 1988. There will be further cuts (up to 15 percent) for these services depending on how the prevailing charge for the service in an area relates to the national average prevailing charge for that service. A full 15 percent will be taken for services where the area prevailing charge is greater than 150 percent of the national prevailing charge with reduced levels of reduction for charges between 150 percent and 100 percent of the national average.

The following are the procedures for which reductions are made: coronary artery bypass surgery; total hip replacement; cataract surgery; transurethral prostatectomy; suprapubic prostatectomy; diagnostic and/or therapeutic dilatation and curettage; carpal tunnel neurolysis and/or transposition; pacemaker surgery; bronchoscopy; upper gastrointestinal endoscopy; and knee arthroscopy and knee arthroplasty.

Medicare reimbursement for ophthalmic ultrasound procedures will be limited to 5 percent of the prevailing charge for cataract surgery with intraocular lens implantation.

3. *New Physicians.* The customary charge for new physicians will be set at 80 percent of the prevailing charge. This provision does not apply to primary care services or to services furnished in rural health manpower shortage areas. For these services, current law will be followed with the customary charge profile set at the 50th percentile of customary charges.

4. *Anesthesiology Special Limits.* Payments for concurrent supervision of certified registered nurse anesthetists will be reduced.

5. *Radiology Fee Schedule.* A fee schedule will be established for radiology services provided by board-certified and board-eligible radiologists or by physicians whose charges for the radiologic service account for 50 percent or more of their Medicare billings. There will be special fee controls on those procedures.

6. *Clinical Laboratory Services.* The 2 percent differential in payment between hospital outpatient labs and independent clinical labs (except for sole community hospitals) will be eliminated. Prevailing charges for automated tests and tests subject to the lowest charge provisions (except cytopathology) will be reduced. Other provisions revise the calculation for payment ceiling, establish intermediate sanctions for labs which no longer substantially meet the conditions for participation for clinical labs, and provides for treatment of high volume physician office labs as independent clinical labs.

7. *Durable Medical Equipment.* There will be a one-year freeze on durable medical equipment payment screens effective January 1, 1988, at levels in effect December 31, 1987.

8. *Radiology Services in Hospital Outpatient Departments.* There will be a limit on aggregate payments for hospital outpatient radiology departments.

9. *Ambulatory Surgery.* Beneficiary cost sharing for

physician services provided in ambulatory surgical centers is reinstituted.

Part B Premium. The Part B premium will continue to provide 25 percent of program costs through calendar year 1989.

Mental Health Services. The maximum payment for outpatient mental health services will increase to \$450 in 1988 and \$1,100 in 1989.

Peer Review Organizations. Numerous changes have been made concerning peer review organizations. A provider or practitioner excluded from the Medicare program by a PRO will be entitled to a hearing before an administrative law judge prior to the effectiveness of the exclusion. PRO contracts will be authorized for three year periods with staggered expiration dates. PROs will be prohibited from publicizing payment denials without first offering the provider or practitioner prior notification and opportunity for discussion. In establishing review standards, PROs will be required to take into account the special problems associated with delivering care in remote rural areas, the availability of service alternatives to inpatient hospitalization, and social factors that could adversely affect safety and effectiveness of outpatient treatment. PROs will be required to perform substantial on-site review in 20 percent of the rural hospitals in the PRO's area. PROs will be required to meet several times each year with hospital medical and administrative staff about PRO review.

B. Provisions Relating to Part A and Part B.

1. *Payment Delays.* Claims will be held for ten days after the date of receipt during the last three months of fiscal year 1988 (July, August, and September 1988) and for 14 days during fiscal year 1989.

IRA: YOUR RETIREMENT NEST EGG

When the Tax Bill of 1986 went into effect, tens of thousands of individuals sent up a collective groan as they saw their annual \$2,000 individual retirement account (IRA) contribution lose its eligibility as a tax deduction.

At first glance, many of us perceived this to be the end of the IRA—after all, the "tax shelter aspect" was the only benefit of an IRA in the first place, wasn't it? Or was it?

But, where IRAs are concerned, our legislators didn't eliminate all the benefits to investors.

For it quickly became apparent, even for those who were ineligible to deduct the IRA contribution annually (and that certainly includes many in the medical profession), there still is one impressive rationale for establishing and contributing to an IRA investment—the tax-free compounding of earnings.

And, make no mistake about it, over time, whether one has 30, 20, 10, or 5 years to accumulate an IRA retirement investment, it makes overwhelming sense—dollars and sense—to do so.

With this as a given, those of you who have an IRA should continue it; those of you who haven't yet established an IRA should consider it a good first retirement planning step to take. Begin it early and contribute regularly.

When you have an IRA as part of your overall retirement package, you'll soon find that tax-deferred compounding in your IRA is a powerful lure.

As long as you have an IRA working for you, you will enjoy tax-deferred earnings while building your financial security. There are no federal income taxes to pay until you start to withdraw the money—as early as age 59½, if you so choose. (If you withdraw any portion of your money before age 59½, there is a 10 percent penalty and taxes to be dealt with.)

Now, what does tax-free compounding of your earnings mean to you?

The accompanying chart dramatically illustrates the value of your IRA's tax-deferred advantage amounting to over \$75,000 of additional earnings versus an identical investment without tax-deferred compounding. The accumulated amounts are based on a \$2,000 annual contribution over a 25-year period, earnings at the annual rate of 10 percent and a 28 percent tax bracket.

But the big question still keeps cropping up: Is it worth investing in an IRA if you cannot deduct the annual contribution?

As you can see, the benefits of tax-deferred compounding allows your money to grow at a much faster rate than if it were in a taxable account, and that's a big plus.

Invest your IRA dollars early in the year in order to take full advantage of tax deferred earnings on your account. If you haven't made your 1987 contribution yet, you have until April 15, 1988, to do so. By doing it now and contributing another \$2,000 for 1988 at the same time, you will optimize the tax-free compounding of your money.

Also, putting \$2,000 into an IRA each year is a good saving discipline and adds up quickly towards your retirement income.

Where to Invest. Naturally, choosing the right types of investments for your Individual Retirement Account is important. Diversification has always been a sound investment strategy. Your IRA assets should be spread among several investments in order to reduce your investment risk in the volatile financial world.

Towards this end, mutual funds provide diversification, are quite compatible with the long-term objectives of your IRA, and offer a number of additional benefits. These include a wide range of objectives, the ability to switch among funds, professional management, liquidity, and easy recordkeeping.

Another point to consider: some mutual funds are offered at net asset value and do not charge a load (a commission). Eliminating the load means 100 percent of your IRA contribution works for you from Day One and that can add up to substantially more retirement dollars for you.

Of course, how you allocate your IRA investments depends on your own personal circumstances—your age, current tax status, income, objectives, the right combination of safety and risk, as well as consideration of your other retirement assets. Any of these may change along the way (including your financial responsibilities—i.e. getting married, having children, college costs, caring for a parent) making it important to keep an eye on your investment mix and altering it accordingly.

Estimate your retirement needs as best you can and make sure you will have enough money to retire comfortably.

If your money is growing according to your expectations and your asset allocation remains appropriate, your portfolio is working well. If not, make some changes and monitor your IRA until you are satisfied with its success rate.

Remember that whatever your circumstances and even though tax reform has limited the deductions on contributions, Individual Retirement Accounts still make sense as a long-range benefit in building and enhancing your retirement nest egg—and if you select properly, that egg may turn out to be golden!

—AMA Advisers

SOCIETY OF ASSOCIATION EXECUTIVES

Joseph C. Lucci, Director of Medical and Insurance Affairs for MSNJ is the new president of the New Jersey Society of Association Executives. Lucci, a native of Trenton, has been a member of the Association since 1973; the group represents the professional staff of the trade and professional associations headquartered in New Jersey. As Director of Medical and Insurance Affairs for the Medical

Society of New Jersey, Lucci is the liaison for third-party payers and all members; he oversees 17 committees for the Society dealing with membership services.

RENTAL CAR DEDUCTIBLE

The Gold Mastercard endorsed by the Medical Society of New Jersey has added a new feature: the rental car deductible reimbursement. Each time you charge a rental car to your credit card you will receive coverage for up to \$3,000 of your deductible for collision damage covered by your own or the rental company's insurance at no additional cost. If your insurance does not cover auto rental collision, a benefit of up to \$3,000 will be paid. To apply for your Gold Mastercard call 1-800-847-7378.

LEGISLATIVE REPORT: CLARK MARTIN, MSNJ LEGISLATIVE CONSULTANT

MEDICAID UPDATE

A two-pronged effort to move primary health care for the poor out of the hospital emergency room and back to the physician's office was detailed by Gov. Kean in his annual budget message to the Legislature.

The plan calls for increasing Medicaid rates for office visits while at the same time forming a Medicaid HMO called the Garden State Health Plan.

Human Services Commissioner Drew Altman, meeting with the Society's Medicaid Committee, said that reorganizing the \$1.6 billion program is his Department's top priority for the 1988-89 fiscal year.

Admitting that too many of the State's poor depend on expensive hospital emergency rooms and clinics for primary care and that too few physicians and other providers now participate in the program—the residue of 15 years' of frozen reimbursement rates—Commissioner Altman said that many details need to be resolved to make Medicaid work.

Altman's initial goal is to raise the current \$7 office rate to \$13-\$15 while enrolling between 1,000 and 1,200 physicians to participate in the Plan.

Ultimately, said Altman, he would like to see Medicaid rates increased to Medicare levels.

PHYSICIAN ASSISTANTS LOSE GROUND

A bill which reaffirms a simple truth—that the Legislature alone has the authority to establish licensing for health care professions—is moving through the Assembly over the objections of a group of physician assistants (PA).

As released by the Health and Human Resources committee, the bill says that no category of health profession should practice, or be licensed to practice, by any state agency unless first authorized by the Legislature. MSNJ and the Nurses Association both testified in favor of the bill before the committee.

Now a "generic" bill addressing all unlicensed health care occupations, A-1591 originally dealt specifically with PAs. Sponsored by Assemblyman John Bennett (R, Freehold), the bill was a response to the Health Department's attempt to persuade the Board of Medical Examiners to license PAs by regulation.

An identical bill, S-1491, has been introduced by Senator Thomas S. Gagliano (R, West Long Branch).

MEDICARE ASSIGNMENT: IT'S BACK!

Two bills which would require physicians to accept Medicare assignment, or else lose their licenses, are among the more than 5,000 measures introduced in the first month of the 1988-89 Legislature.

Sponsors of the identical measures are Senator Carmen A. Orechio, Democrat of Nutley, and Assemblyman Alan J. Karcher, Democrat of Sayreville. The bills, S-1649 and A-2305, have been referred to the Health Committees in their respective houses.

Action on this issue more likely would occur this session in the Senate. As Society members so vividly recall, a Medicare assignment bill (A-2511) was voted down unanimously by the Assembly Health Committee less than a year ago. We're in a new legislative session, but the committee's membership is unchanged.

The Senate committee last year did not schedule a

hearing on the Medicare assignment bill. Senator Orechio discussed the issue thoroughly with the Essex County Medical Society and various senior citizens' groups, learned about the "courtesy" program in Essex and other counties, and was apprised of the Assembly committee's vote.

Whether the bill will be scheduled for committee consideration in the Senate is difficult to predict. Perhaps the most important factor is to what degree the "courtesy" programs are successful.

COMMITTEE ROSTERS ANNOUNCED

Senate President John F. Russo and Assembly Speaker Chuck Hardwick have named the following members to serve on the reference committees which will review bills affecting medicine in the 1988-89 Legislature:

Senate

Institutions, Health and Welfare

Richard J. Codey (D, West Orange), Chair

Francis J. McManimon (D, Trenton)

Gabriel M. Ambrosio (D, Lyndhurst)

C. Louis Bassano (R, Union)

John H. Dorsey (R, Mountain Lakes)

Labor, Industry and Professions

Raymond Lesniak (D, Elizabeth), Chair

Christopher J. Jackman, (D, North Bergen)

Edward T. O'Connor, Jr., (D, Jersey City)

Gerald Cardinale (R, Cresskill)

Donald T. DiFrancesco (R, Scotch Plains)

Judiciary

Edward T. O'Connor, Jr., (D, Jersey City), Chair

Raymond J. Zane (D, Woodbury)

Gabriel M. Ambrosio (D, Lyndhurst)

Richard J. Codey (D, West Orange)

John A. Lynch (D, New Brunswick)

Carmen A. Orechio (D, Nutley)

Richard Van Wagner (D, Red Bank)

Donald T. DiFrancesco (R, Scotch Plains)

John H. Dorsey (R, Mountain Lakes)

William L. Gormley (R, Atlantic City)

Lee B. Laskin (R, Cherry Hill)

Assembly

Health and Human Resources

Harold L. Colburn, M.D., (R, Mount Holly), Chair

Nicholas R. Felice (R, Fair Lawn)

Rodney P. Frelinghuysen (R, Morristown)

Thomas J. Deverin (D, Elizabeth)

George J. Otlowski (D, Perth Amboy)

Higher Education and Regulated Professions

Jeffrey Moran (R, Forked River), Chair

Dolores G. Cooper (R, Atlantic City)

Jack Collins (R, Woodstown)

Joseph V. Doria (D, Bayonne)

Anthony Imprevuto (D, Secaucus)

Insurance

Ralph A. Loveys (R, Parsippany), Chair

Clare M. Farragher (R, Freehold)

Richard Kamin (R, Succasunna)

Michael F. Adubato (D, Newark)

Joseph Charles, Jr. (D, Jersey City)

LEGISLATIVE UPDATE

Status of Legislation on Which MSNJ Has Taken an Active Position

Bill	Subject	MSNJ Position	Committee	Present Status
S-100 Bubba	Requires physicians to personally present and obtain surgical consent forms and signatures. The form shall state the name of any assisting physician that performs surgery under the supervision of the attending.	Active Opposition	Senate: LIP	In committee
S-124 Bubba	Requires express written consent to surgery except in cases of physical or mental incapacity or emergencies. The State Board, after consultation with the Health Department, MSNJ, and the Hospital Association shall prescribe the consent forms which shall be used by physicians.	Active Support	Senate: LIP	Passed in Senate; in Assembly committee (HHR)
S-179 Brown	Requires the Department of Health to prepare a booklet on breast cancer which must be given to breast cancer patients by their physicians.	Active Opposition	Senate: IHW	Out of committee; 2nd reading
S-281 Dumont	Provides for a three-year statute of limitations, except for fraud, intentional concealment, or nontherapeutic or diagnostic purpose. Minors have until age 11 on any injury prior to age 8.	Active Support	Senate: JUD	In committee
S-345 Ewing	Creates a commission to advise the governor and the legislature regarding any new proposals to regulate or license new professions.	Active Support	Senate: LIP	Out of committee; 2nd reading
S-403 Rand	Grants immunity to peer review organizations when the organization is recognized by the Dept. of Health. Also, provides for confidentiality of materials and records of the PRO.	Active Opposition	Senate: IHW	In committee
S-440 Garibaldi	Provides that cancers caused by exposure to heat, cold, radiation, or a known carcinogen which manifest themselves in active police or firemen are assumed to be accidental and work-related disabilities.	Active Opposition	Senate: SGF&IR&VA	In committee
S-492 Garibaldi	Requires a second physician to be present at any termination of pregnancy procedure if the attending has determined the unborn fetus is 24 weeks of age or older. The second physician is to provide immediate care to the child if it is born alive.	Active Opposition	Senate: IHW	In committee

Assembly Reference Committees

HHR: Health and Human Resources
 HERP: Higher Education and Regulated Professions
 JUD: Judiciary
 SG: State Government
 INS: Insurance
 SC: Senior Citizens
 EDA: Economic Development and Agriculture

Senate Reference Committees

LIP: Labor, Industry, and Professions
 SGF&IR&VA: State Government, Federal & Interstate Relations & Veterans Affairs
 IHW: Institutions, Health & Welfare
 JUD: Judiciary
 RFA: Revenue, Finance & Appropriations
 CH: Children Services

Bill	Subject	MSNJ Position	Committee	Present Status
S-493 Garibaldi	Requires the State Board of Medical Examiners to conduct a study as to when fetal viability occurs so that the conduct of physicians may be governed accordingly. Having conducted such a study, the Board is to promulgate guidelines regarding the termination of pregnancy.	Active Opposition	Senate: IHW	In committee
S-539 Cardinale	Exempts the private practice of medicine from the certificate of need law.	Active Support	Senate: IHW	In committee
S-600 Bassano	Requires every physician attending a woman at the time of delivery, miscarriage, abortion, or during the prenatal period to perform an Rh test. If the test is Rh negative the physician shall, within 24 hours of the receipt of result, advise patient of its significance and availability of preventive treatment.	Active Opposition		Signed into law as c. 166 P.L. 1987*
S-935 Feldman	Provides that within 60 days of filing an action against a physician the plaintiff must provide an affidavit from an expert that there has been negligent deviation from the accepted standards of practice.	Active Support	Senate: JUD	In committee
S-962 Feldman	Makes the decision of an Administrative Law Judge final in contested agency actions.	Active Support	Senate: JUD	In committee
S-1197 Jackman	Creates a separate licensing and regulatory board for chiropractic.	Active Opposition	Senate: LIP	In committee
S-1221 Codey	Removes the requirement that the State Commissioner of Health shall be a duly licensed physician.	Active Opposition	Senate: IHW	In committee
S-1241 Codey	Amends the certificate of need to include physicians whenever a health service has been regionalized by regulation of the Department of Health. Regulation would terminate within three years, at which time, the Commissioner could readopt the regulation.	Active Opposition	Senate: IHW	In committee
S-1283 Hirkala	Extends confidentiality to data in the possession of hospital peer review committee.	Active Support	Senate: IHW	In committee
S-1309 Contillo	Provides for a nonbinding referendum concerning the enactment of a national health plan.	Active Opposition		Passed in Senate; in Assembly HHR
S-1583 Lesniak	Provides that physicians shall not be exempted from malpractice claims by fellow employees.	Active Opposition	Senate: LIP	In committee
S-1801 Dorsey	Requires food processors and public eating places to provide written notice regarding irradiated foods.	Active Opposition	Senate: IHW	In committee
S-1841 Dalton	Provides that collateral sources of payment shall be used to offset damages. Further provides that periodic payments may be used at the request of either party if the future damages exceed \$100,000.	Active Support	Senate: JUD	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
S-1878 Cardinale	Limits noneconomic damage awards to \$100,000.	Active Support	Senate: JUD	In committee
S-1979 McManimon	Eliminates the requirement that prescriber's address and registry number be included on the prescription label.	Active Support	Senate: IHW	Signed into law as c.75 P.L. 1986*
S-2041 McManimon	Establishes local area health planning agencies to continue the program being terminated by the federal government. Funds will be provided by the state with an offset for any federal money received.	Active Opposition	Senate: IHW	In committee
S-2102 McNamara	Establishes a demonstration project to allow hospitals to designate surplus acute beds as swing beds for skilled nursing care.	Active Support	Senate: IHW	In committee
S-2129 Russo	Prohibits physicians from employing physical therapists, owning a physical therapy practice, or any interest in a physical therapy practice.	Active Opposition	Senate: IHW	In committee
S-2137 McManimon	Creates a "local health planning" system to operate the certificate of need apparatus. The agencies would be funded by a special tax on hospitals.	Active Opposition	IHW	In committee
S-2187 Brown	Allows a licensed professional registered nurse to serve as the Commissioner of Health.	Active Opposition	Senate: IHW	In committee
S-2261 Lynch	Permits optometrists to use drugs for treatment and diagnostic purposes.	Active Opposition	Senate: IHW	Laid over
S-2290 Bassano	Makes AIDS reportable. Grants immunity to physicians who deem it advisable to inform patient's sexual partners.	Active Support	Senate: JUD	In committee
S-2385 Cardinale	Places a \$350,000 cap on awards for pain and suffering. The limit shall be revised annually by the Consumer Price Index—U.S.—City Average.	Active Support	Senate: JUD	In committee
S-2398 Bassano	Eliminates joint and several liability.	Active Support	Senate: JUD	In committee
S-2403 Bassano	Provides that benefits from collateral sources shall be deducted from awards in personal injury actions.	Active Support	Senate: JUD	In committee
S-2473 Orechio	Requires health care licensees to accept Medicare determination of their fees.	Active Opposition	Senate: IHW	In committee
S-2585 Garibaldi	Requires health care licensees to accept Medicare determinations of their fees.	Active Opposition	Senate: IHW	In committee
S-2644 Lesniak	Limits noneconomic loss in tort cases to \$500,000 unless the injury includes significant and severe permanent disability including permanent disfigurement.	Active Opposition	Senate: JUD	In committee
S-2703 Lesniak	Modifies the application of joint and several liability in tort actions.	Active Opposition	Senate: JUD	Signed into law as c.325 P.L. 1987*
S-2706 Lesniak	Provides for structured payments exceeding \$200,000.	Active Support	Senate: JUD	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
S-2707 Russo	Limits noneconomic loss in tort cases to \$500,000 unless the injury includes significant and severe permanent disability including permanent disfigurement.	Active Opposition	Senate: JUD	In committee
S-2721 Lipman	Authorizes nurses to practice medicine and to prescribe drugs and devices.	Active Opposition	Senate: LIP	In committee
S-3284 Zimmer	Permits emergency medical technicians certified by the Commissioner of Health as an EMT-D to perform cardiac defibrillation.	Active Support	Senate: IHW	In committee
S-3500 McManimon	Allows psychologists to certify disability.	Active Opposition	Senate: LIP	In committee
S-3696 McManimon	Appropriates \$650,000 to fund local health planning.	Active Opposition	Senate: RFA	In committee
SR-5 Bubba	Requests Congress to reject taxing health benefit packages.	Active Support	Senate: SGF&IR&VA	In committee
SR-59 Pallone	Condemns HCFA for deliberate delays in processing Medicare claims.	Active Support	Senate: IHW	In committee
SJR-42 McManimon	Establishes a commission to study the possibility of using health enterprise zones in New Jersey to counteract adverse market conditions.	Active Support	Senate: IHW	Out of committee; 2nd reading
A-137 Muhler	Creates a 27-person Board within the Department of Human Services vested with the authority to release or continue the commitment of persons who were found incapable of standing trial or not guilty by reasons of insanity. A Superior Court judge currently makes these decisions.	Active Opposition	Assembly: HHR	In committee
A-181 Villanc	This bill would establish and license two categories of social workers and would create a Board of Social Work Examiners in the Department of Law and Public Safety whose powers and duties, among others, would be to administer the act, examine and license candidates for the various categories of social work, and promulgate rules and regulations necessary for the effective enforcement of the act. The two categories of licensed social work would be 1) social work specialists, who would be required to have a doctorate in social work or a master's degree from an accredited school of social work and 2) social workers who would need a baccalaureate degree from an accredited college or university social work or social welfare program. The bill would "grandfather" in all persons in practice in one of the two licensed categories for two of the last five years who apply to be licensed within 180 days from act date.	Active Opposition	Assembly: HERP	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
A-200 Kosco	Creates a Commission to study the certificate of need process. The Commission would consist of 15 members. Two of the 15 would be physicians. Their report is to be submitted to the legislature and the governor.	Active Support	Assembly: HHR	Passed in Assembly; In Senate committee JUD; 2nd reading
A-360 Garvin	Requires the Department of Health and the State Board of Medical Examiners to prepare a booklet on all aspects of the treatment of breast cancer. Attending physicians are required to distribute the book to appropriate patients and to discuss it with them.	Active Opposition	Assembly: HHR	In committee
A-478 Muziani	Directs the State Board of Medical Examiners to review the issue of when fetal viability occurs and to provide guidelines to physicians regarding procedures to terminate pregnancy.	Active Opposition	Assembly: HHR	In committee
A-479 Muziani	Requires a second physician to be present whenever a physician terminates a pregnancy involving a live fetus of 24 weeks of age or older.	Active Opposition	Assembly: HHR	In committee
A-482 Muziani	Requires a physician to advise pregnant patients of the effects of alcohol and certain drugs on a fetus. The woman shall sign a form confirming the advice was given. The physician is to retain the original and provide the patient with a copy.	Active Opposition	Assembly: HHR	In committee
A-716 Miller	Allows patients or insurers to appeal excessive charges under the DRG program.	Active Support	Assembly: HHR	In committee
A-718 Miller	Terminates the DRG program and requires the Department of Health to develop an alternate system within one year.	Active Support	Assembly: HHR	In committee
A-737 Miller	Provides that collateral sources of payment shall be used to offset damages. Further provides structured payments may be used at the request of either party if the future damages exceed \$100,000.	Active Support	Assembly: JUD	In committee
A-738 Miller	Provides a \$100,000 cap on damages for pain and suffering to personal injury actions.	Active Support	Assembly: JUD	In committee
A-739 Miller	Establishes a 3-year statute of limitations in tort actions against health care providers. Children would have until 11 to bring an action for injuries prior to age 8. After age 8, they come under the 3-year standard. Fraud, concealment, and unintentional foreign bodies "toll" the statute.	Active Support	Assembly: INS	Out of committee; amended; 2nd reading
A-740 Miller	Provides that within 60 days of filing a medical malpractice complaint, the plaintiff must supply an affidavit, by a qualified expert, that reasonable cause exists to believe malpractice occurred.	Active Support	Assembly: INS	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
A-776 Weidel	Provides that terminally ill patients may direct their physicians, through a written document to withhold or withdraw mechanical or artificial means to sustain or supplant vital function when those acts will only artificially prolong death. The directive shall comply with statutory form. The physician relying upon it shall determine it complies with the statute.	Active Opposition	Assembly: JUD	Out of committee; amended; 2nd reading
A-947 Schuber	Transfers the Office of Administrative Law from the Executive Branch to the Judicial Branch. The initial decision made by the agency directly or by report from an administrative law judge. All appeals would then be heard by another administrative law judge. The next appeal would be to the Appellate Division.	Active Support	Assembly: JUD	In committee
A-998 Doria	Creates a commission to review licensing legislation being proposed by any legislator. The commission is to file a report with the governor and the legislature on the necessity of establishing the licensing mechanism being reviewed.	Active Support	Assembly: HERP	Passed in Assembly; in Senate RFA Committee
A-1008 Doria	Creates a licensing board for chiropractic. Transfers all functions and responsibilities of the SBME regarding chiropractic to the new board. Removes the place for a chiropractor from the medical board.	Active Opposition	Assembly: HERP	In committee
A-1422 Mazur	Proposes a nonbinding referendum on whether national health insurance is desirable.	Active Opposition	Assembly: HHR	In committee
A-2283 Kelly	Limits damages for noneconomic loss to \$250,000 in civil suits.	Active Support	Assembly: INS	In committee
A-2373 Kavanaugh	Requires professional liability carriers to report all claims and awards to the Insurance Department. The Department shall report to the licensing boards and they will make the information public.	Active Opposition	Assembly: INS	In committee
A-2379	Establishes local area health planning agencies to continue the program being terminated by the federal government. Funds will be provided by the state with an offset for any federal money received.	Active Opposition	Assembly: HHR	In committee
A-2380 Kern	Same as A-2379 except that this bill also appropriates \$1.8 million to fund the system.	Active Opposition	Assembly: HHR	In committee
A-2400 Loveys	Establishes a three-tier monetary cap on award for pain and suffering. The caps are \$5,000 for minor injury, \$300,000 for major injuries, and \$100,000 for all others. The bill also places limits on overall liability of public entities.	Active Support	Assembly: INS	Passed in Assembly; in Senate JUD committee

Bill	Subject	MSNJ Position	Committee	Present Status
A-2401 Weidel	Eliminates joint and several liability and establishes the collateral source rule so that plaintiffs cannot collect more than once for the same loss. Establishes that state-of-the-art, adequate warning and open and obvious defenses for product liability. Also, provides that 95 percent of punitive damages will be paid to the state, rather than the plaintiff. Establishes a fund to pay excess awards levied against public entities.	Active Support	Assembly: INS	Passed in Assembly; in Senate JUD committee
A-2402 Zecker	Requires structured settlements for awards in excess of \$300,000.	Active Support	Assembly: INS	Passed in Assembly; in Senate JUD committee
A-2403 Kelly	Requires arbitration of all claims below \$20,000.	Active Support	Assembly: INS	Passed in Assembly; in Senate JUD committee
A-2404 Rafferty	Requires insurance companies to provide the New Jersey Insurance Department with specific data to support its rate request.	Active Support	Assembly: INS	Out of committee; 2nd reading
A-2428 Deverin	Provides for arbitration of claims when the noneconomic loss asserted is less than \$20,000.	Active Support	Assembly: INS	In committee
A-2495 Moran	Requires the New Jersey Division on Aging and the New Jersey Department of Health to publish a list of doctors who charge more than Medicare allowances. Senior citizens who are charged more than Medicare allowances are encouraged to file complaints with the county office on aging.	Active Opposition	Assembly: SC	Out of committee; 2nd reading
A-2511 Doyle and Karcher	Requires health care providers to accept Medicare assignment.	Active Opposition	Assembly: HHR	In committee
A-2519 Doria	Professional liability bill.	Active Opposition	Assembly: INS	In committee
A-2535 Kelly	Authorizes nurses to prescribe medications.	Active Opposition	Assembly: HERP	In committee
A-2559 Felice	Prohibits institutions from operating retail pharmacies within 1,500 feet of their facility.	Active Opposition		Passed in Senate and Assembly
A-2603 Kelly	Requires food processors and retailers to provide written notice if food has been preserved by radiation.	Active Opposition	Assembly: EDA	Out of committee; 2nd reading
A-2647 Haytaian	Prohibits physicians from employing physical therapists, owning a physical therapy practice, or any interest in a physical therapy practice.	Active Opposition	Assembly: HERP	Out of committee; amended; 2nd reading
A-2651 Villane	Provides for the licensing of social workers and would allow them to engage in psychotherapy.	Active Opposition	Assembly: HHR	In committee
A-2878 Doria	Permits dentists who have had their credentials approved to practice in hospitals.	Active Opposition	Assembly: HERP	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
A-3305 Singer	Requires licensed health care providers who treat Medicare enrollees to accept the Medicare fee determination if the beneficiary presents to the provider a valid PAAD card.	Active Opposition	Assembly: HHR	In committee
A-3434 Loveys	Amends the Insurance Fraud and Prevention Act to eliminate the verification of medical bills submitted with insurance claims.	Active Support	Assembly: INS	Signed into law as c. 342 P.L. 1987*
A-3438 Colburn	Creates a study commission to review the DRG program for its impact on the quality of care and to determine whether it should be continued.	Active Support	Assembly: HHR	Passed in Assembly; in Senate committee (IHW)
A-3751 Loveys	Requires structured payments when future damages exceed \$200,000 by means of an annuity contract.	Active Support	INS	In committee
A-3777 Colburn	Allows hospitals to undertake outpatient projects costing no more than \$2,000,000 without obtaining a certificate of need.	Active Support	INS	In committee
A-4465 Penn	Permits psychologists to certify disability under the temporary disability benefits law.	Active Opposition	LIP	In committee
A-4466 Loveys	Eliminates joint and several liability except for environmental torts.	Active Support	INS	Out of committee; 2nd reading
A-4515 Kern	Appropriates \$650,000 to fund local health planning.	Active Opposition	HHR	In committee
A-4615 Loveys	Provides for structured payments of future damages exceeding \$200,000.	Active Support	INS	Out of committee; 2nd reading
AJR-49 Felice	Directs the Commissioner of Health to study and report on the feasibility of health enterprise zones.	Active Support		Signed into law as c. JR6 P.L. 1987*
AR-141 Singer	Commends the Union and Ocean County Medical Societies for their senior citizen medical courtesy programs.	Active Support	HHR	In committee
AR-143 Farragher	Requests Congress to raise fees to doctors participating in Medicare.	Active Support	HHR	In committee
AR-156 Kalik	Requests Congress to provide Medicare recipients with catastrophic illness coverage.	Active Support	HHR	In committee

N.B. All of the foregoing bills expired at the end of the 1986-1987 Legislative Year or were filed or conditionally vetoed by the Governor. The asterisk (*) denotes bills that were signed into law during this time.

The World's Most Popular K^{*}

Slow-K[®]
potassium chloride
slow-release tablets
8 mEq (600 mg)

It means "dependability" in almost any language

*Based on worldwide sales data on file, CIBA Pharmaceutical Company.
Capsule or tablet slow-release potassium chloride preparations should be reserved for patients who cannot tolerate, refuse to take, or have compliance problems with liquid or effervescent potassium preparations because of reports of intestinal and gastric ulceration and bleeding with slow-release KCl preparations.

Before prescribing, please consult Brief Prescribing Information on next page.

C I B A

The World's Most Popular K

For good reasons

- ❑ **It works**—a 12-year record of efficacy¹
- ❑ **It's safe**—unsurpassed by any other KCl tablet or capsule^{2*}
- ❑ **It's acceptable vs liquids**—greater palatability, fewer GI complaints, lower incidence of nausea²
- ❑ **It's comparable to 10 mEq**—in low-dosage supplementation^{3†}
- ❑ **It's economical**—less expensive than all other leading KCl slow-release supplements on a per tablet cost to the patient¹

Slow-K®
potassium chloride
slow-release tablets 8 mEq (600 mg)

For patients who can't or won't tolerate liquid KCl.

*The most common adverse reactions to potassium salts are gastrointestinal side effects.

†Pooled mean serum potassium following oral administration of 30 mEq K-Tab compared to 24 mEq Slow-K in diuretic-treated hypertensives (n = 20) over 8 weeks.

Slow-K®
potassium chloride USP
Slow-Release Tablets
8 mEq (600 mg)

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE INSERT)

INDICATIONS AND USAGE

BECAUSE OF REPORTS OF INTESTINAL AND GASTRIC ULCERATION AND BLEEDING WITH SLOW-RELEASE POTASSIUM CHLORIDE PREPARATIONS, THESE DRUGS SHOULD BE RESERVED FOR THOSE PATIENTS WHO CANNOT TOLERATE OR REFUSE TO TAKE LIQUID OR EFFERVESCENT POTASSIUM PREPARATIONS OR FOR PATIENTS IN WHOM THERE IS A PROBLEM OF COMPLIANCE WITH THESE PREPARATIONS.

1. For therapeutic use in patients with hypokalemia with or without metabolic alkalosis; in digitalis intoxication and in patients with hypokalemic familial periodic paralysis.
2. For prevention of potassium depletion when the dietary intake of potassium is inadequate in the following conditions: patients receiving digitalis and diuretics for congestive heart failure; hepatic cirrhosis with ascites; states of aldosterone excess with normal renal function; potassium-losing nephropathy; and certain diarrheal states.

3. The use of potassium salts in patients receiving diuretics for uncomplicated essential hypertension is often unnecessary when such patients have a normal dietary pattern. Serum potassium should be checked periodically, however, and if hypokalemia occurs, dietary supplementation with potassium-containing foods may be adequate to control milder cases. In more severe cases supplementation with potassium salts may be indicated.

CONTRAINDICATIONS

Potassium supplements are contraindicated in patients with hyperkalemia, since a further increase in serum potassium concentration in such patients can produce cardiac arrest. Hyperkalemia may complicate any of the following conditions: chronic renal failure, systemic acidosis such as diabetic acidosis, acute dehydration, extensive tissue breakdown as in severe burns, adrenal insufficiency, or the administration of a potassium-sparing diuretic (e.g., spironolactone, triamterene) (see OVERDOSAGE).

All solid dosage forms of potassium supplements are contraindicated in any patient in whom there is cause for arrest or delay in tablet passage through the gastrointestinal tract. In these instances, potassium supplementation should be with a liquid preparation. Wax-matrix potassium chloride preparations have produced esophageal ulceration in certain cardiac patients with esophageal compression due to an enlarged left atrium.

WARNINGS

Hyperkalemia (See OVERDOSAGE).

In patients with impaired mechanisms for excreting potassium, the administration of potassium salts can produce hyperkalemia and cardiac arrest. This occurs most commonly in patients given potassium by the intravenous route but may also occur in patients given potassium orally. Potentially fatal hyperkalemia can develop rapidly and be asymptomatic.

The use of potassium salts in patients with chronic renal disease, or any other condition which impairs potassium excretion, requires particularly careful monitoring of the serum potassium concentration and appropriate dosage adjustment.

Interaction With Potassium-Sparing Diuretics

Hypokalemia should not be treated by the concomitant administration of potassium salts and a potassium-sparing diuretic (e.g., spironolactone or triamterene), since the simultaneous administration of these agents can produce severe hyperkalemia.

Gastrointestinal Lesions

Potassium chloride tablets have produced stenotic and/or ulcerative lesions of the small bowel and deaths. These lesions are caused by a high localized concentration of potassium ion in the region of a rapidly dissolving tablet, which injures the bowel wall and thereby produces obstruction, hemorrhage, or perforation. Slow-K is a wax-matrix tablet formulated to provide a controlled rate of release of potassium chloride and thus to minimize the possibility of a high local concentration of potassium ion near the bowel wall. While the reported frequency of small-bowel lesions is much less with wax-matrix tablets (less than one per 100,000 patient-years) than with enteric-coated potassium chloride tablets (40-50 per 100,000 patient-years) cases associated with wax-matrix tablets have been reported both in foreign countries and in the United States. In addition, perhaps because the wax-matrix preparations are not enteric-coated and release potassium in the stomach, there have been reports of upper gastrointestinal bleeding associated with these products. The total number of gastrointestinal lesions remains approximately one per 100,000 patient-years. Slow-K should be discontinued immediately and the possibility of bowel obstruction or perforation considered if severe vomiting, abdominal pain, distention, or gastrointestinal bleeding occurs.

Metabolic Acidosis

Hyperkalemia in patients with metabolic acidosis should be treated with an alkalinizing potassium salt such as potassium bicarbonate, potassium citrate, or potassium acetate.

PRECAUTIONS

General:

The diagnosis of potassium depletion is ordinarily made by demonstrating hypokalemia in a patient with a clinical history suggesting some cause for potassium depletion. In interpreting the serum potassium level, the physician should bear in mind that acute alkalosis per se can produce hypokalemia in the absence of a deficit in total body potassium, while acute acidosis per se can increase the serum potassium concentration into the normal range even in the presence of a reduced total body potassium.

Information for Patients

Physicians should consider reminding the patient of the following:

To take each dose without crushing, chewing, or sucking the tablets.
To take this medicine only as directed. This is especially important if the patient is also taking both diuretics and digitalis preparations.

To check with the physician if there is trouble swallowing tablets or if the tablets seem to stick in the throat.

To check with the doctor at once if tarry stools or other evidence of gastrointestinal bleeding is noticed.

Laboratory Tests

Regular serum potassium determinations are recommended. In addition, during the treatment of potassium depletion, careful attention should be paid to acid-base balance, other serum electrolyte levels, the electrocardiogram, and the clinical status of the patient, particularly in the presence of cardiac disease, renal disease, or acidosis.

Drug Interactions

Potassium-sparing diuretics: see WARNINGS.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies in animals have not been performed.

Pregnancy Category C

Animal reproduction studies have not been conducted with Slow-K. It is also not known whether Slow-K can cause fetal harm when administered to a pregnant woman or can affect reproductive capacity. Slow-K should be given to a pregnant woman only if clearly needed.

Nursing Mothers

The normal potassium ion content of human milk is about 13 mEq/L. It is not known if Slow-K has an effect on this content. Caution should be exercised when Slow-K is administered to a nursing woman.

Pediatric Use

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

One of the most severe adverse effects is hyperkalemia (see CONTRAINDICATIONS, WARNINGS, and OVERDOSAGE). There also have been reports of upper and lower gastrointestinal conditions including obstruction, bleeding, ulceration, and perforation (see CONTRAINDICATIONS and WARNINGS); other factors known to be associated with such conditions were present in many of these patients.

The most common adverse reactions to oral potassium salts are nausea, vomiting, abdominal discomfort, and diarrhea. These symptoms are due to irritation of the gastrointestinal tract and are best managed by taking the dose with meals or reducing the dose.

Skin rash has been reported rarely.

OVERDOSAGE

The administration of oral potassium salts to persons with normal excretory mechanisms for potassium rarely causes serious hyperkalemia. However, if excretory mechanisms are impaired or if potassium is administered too rapidly intravenously, potentially fatal hyperkalemia can result (see CONTRAINDICATIONS and WARNINGS). It is important to recognize that hyperkalemia is usually asymptomatic and may be manifested only by an increased serum potassium concentration (6.5-8.0 mEq/L) and characteristic electrocardiographic changes (peaking of T waves, loss of P wave, depression of S-T segment, and prolongation of the Q-T interval). Late manifestations include muscle paralysis and cardiovascular collapse from cardiac arrest (9-12 mEq/L).

Treatment measures for hyperkalemia include the following: (1) elimination of foods and medications containing potassium and of potassium-sparing diuretics; (2) intravenous administration of 300-500 mEq of 10% dextrose solution containing 10-20 units of insulin per 1,000 ml; (3) correction of acidosis, if present, with intravenous sodium bicarbonate; (4) use of exchange resins, hemodialysis, or peritoneal dialysis.

In treating hyperkalemia in patients who have been stabilized on digitalis, too rapid a lowering of the serum potassium concentration can produce digitalis toxicity.

DOSEAGE AND ADMINISTRATION

The usual dietary intake of potassium by the average adult is 40-80 mEq per day. Potassium depletion sufficient to cause hypokalemia usually requires the loss of 200 or more mEq of potassium from the total body store. Dosage must be adjusted to the individual needs of each patient but is typically in the range of 20 mEq per day for the prevention of hypokalemia to 40-100 mEq or more per day for the treatment of potassium depletion. Large numbers of tablets should be given in divided doses.

Note: Slow-K slow-release tablets must be swallowed whole and never crushed, chewed, or sucked.

HOW SUPPLIED

Tablets—600 mg of potassium chloride (equivalent to 8 mEq) round, buff colored, sugar-coated (imprinted Slow-K).

Bottles of 100 NDC 0083-0165-30
Bottles of 1000 NDC 0083-0165-40

Consumer Pack—One Unit
12 Bottles—100 tablets each NDC 0083-0165-65

A National Disgrace

A Health Service Grant awarded to the Academy of Medicine of New Jersey focuses on physician education in the prevention of diabetes-related lower extremity amputations.

The word association with diabetes in the minds of many people is gangrene or leg amputation. Unfortunately, that is more true in 1988 than we would like to believe and that is a national disgrace.

Several years ago, the National Institutes of Health, Centers for Disease Control, through the New Jersey State Department of Health Diabetes Control Program, designated New Jersey as a Diabetes Control Demonstration State. One of our initial and major interests has been lower extremity amputations (LEAs). A study of the subject in New Jersey was reported in this journal in 1985 by Miller et al.¹ The data showed that 1,448 LEAs were performed each year between 1979 and 1981 and further tracking has shown an increase to 1,800 in 1986.

That shocking statistic must be coupled with cost: \$20 million per year for hospital costs alone, with an extrapolated total annual cost of \$100 million to our

state when one considers direct and indirect costs—lost wages, lost taxes, and premature death.² Furthermore, it points up that the national figures are understated and that there probably are 100,000 LEAs each year in the United States with an extrapolated health care cost of \$6 to \$7 billion. The disgrace is that half of those LEAs can be prevented.

The Academy of Medicine of New Jersey was awarded a Health Service Grant, through the Centers for Disease Control-New Jersey State Department of Health entitled "Physician Education—Prevention of Diabetes-related Lower Extremity Amputations (LEAs)." We now are hard at work implementing the program. The premise of our approach is that the key figures in this drama are the patient and the family physician. Thus, the program will work in conjunction with the New Jersey Academy of Family Physicians with the cooperation of the New Jersey Pharmaceutical Association.

The key elements of this three-year educational and research program, which initially will be aimed at the two counties with the highest amputation rates and two control counties, will include the following:

- A two-hour video program on primary, secondary, and tertiary prevention of LEAs.
- A two-hour workshop, "Prevention of Lower Extremity Amputations in Diabetics," at the New Jersey Academy of Family Practice Annual Meeting in 1988, 1989, and 1990.
- Roving Symposia arranged by the Academy of Medicine of New Jersey in the two research counties.
- Statewide Roving Symposia.
- A monograph on prevention of LEAs in diabetes will be distributed.
- A newsletter and additional materials on the subject will be distributed during the project.
- Selected family physicians will be offered an opportunity to participate in the research component of the project.

We hope to demonstrate that education, enhanced skills and knowledge, and change in behavior by both patients and physicians can reduce the loss of legs and money by persons with diabetes in our state. We will need your participation.

A.K.

WE SCHEDULE LITHOTRIPSY FOR THE PATIENT'S CONVENIENCE AND YOURS.

The Mid-Atlantic Kidney Stone Center is proud of its prompt and convenient scheduling. Depending on the urgency of the situation, your patient will undergo lithotripsy treatment promptly, usually within one week of referral. In urgent cases, we combine evaluation and treatment on the same day.

In our nearly two years of practice as a lithotripsy service, we have treated more than 2000 patients, gaining the confidence of referring physicians in New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware.

Your relationship with

Preventing Tobacco Dependence

JOHN D. SLADE, M.D.*

The New Jersey Commission on Smoking or Health is ready to help us focus on the problems caused by tobacco.

The report by the Commission on Smoking or Health on children and tobacco which appeared in last month's special issue of *NEW JERSEY MEDICINE* summarized a variety of approaches for controlling the tobacco epidemic by focusing prevention efforts on the initial stages of nicotine dependence.¹ Since the original report was issued, the Commission added two recommendations.

The first item concerned the Commission's recommendation for smoke-free environments for children. The original report contains a recommendation that all primary and secondary schools be completely tobacco-free. Because of the risk of involuntary smoking to children² and because of the way children model adult behavior, the Commission has extended this recommendation to apply to any place where children usually are present. This includes not only schools, but day care facilities, latch-key programs, and recreational and entertainment facilities for the young. It also includes homes in which there are children.

The second item is a new recommendation, concerning the substantial proportion of teenagers in New Jersey that already have nicotine dependence. A survey conducted by the State Department of Law and Public Safety among 10th, 11th, and 12th graders indicates

that 40 percent of those surveyed use tobacco regularly, and half use it daily.³ In addition to preventing the onset of tobacco use, treating nicotine dependence in this age group should be a priority for public health and education officials. Treatment in this population has not been well studied up to now, but this situation may be improving.⁴

The Commission on Smoking or Health has a diverse membership, and each individual has made substantial contributions. Those who compiled the report on children are: Mrs. Thomas Kean, Honorary Chairperson; Dr. Lee Reichman, Chairperson, Department of Medicine, UMDNJ-New Jersey Medical School; Mrs. Laura Bauvais-Godwin, New Jersey Chapter, Society for Public Health Education; Mrs. Regina Carlson, New Jersey Group Against Smoking Pollution; Mrs. Jane DeMaio, New Jersey State Department of Education; Mrs. Iolanda Gaglioti, New Jersey Congress of Parents and Teachers; Mr. Richard Gardiner, New Jersey State Department of Treasury; Mrs. Shirley Greene, New Jersey Interagency Council on Smoking or Health; Dr. Norman Hymowitz, Department of Psychiatry, UMDNJ-New Jersey Medical School; Mr. Daniel Jordan, New Jersey Health Officers Association; Mr. Lester Kurtz, New Jersey Business and Industry Association; Mr. Edward Lawson, Prudential Insurance Company; Mr. Richard Lloyd, Blue Cross and Blue Shield of New Jersey; Mr. Octavius Reid, New Jersey School Boards Association; Dr. John Slade, Department of Medicine, UMDNJ-Robert Wood Johnson Medical School; Mrs. Beulah Walter, American Association of Retired Persons, New Jersey Chapter; Dr. Richard Watson, Johnson and Johnson; and Dr. Elizabeth Wilson, New Jersey State Nurses Association. Staff support in the Department of Health was provided by Dr. Lawrence Meinert, Mrs. Janice Marshall, and Mr. George Wasser.

The Commission now is seeking ways to implement the recommendations it has developed. The Board of Trustees of the Medical Society of New Jersey have endorsed the report. We ask that each of you also join in this effort.

Before prescribing, see complete prescribing information in SK&F LAB CO. literature or PDR. The following is a brief summary.

Contraindications: There are no known contraindications to the use of 'Tagamet'.

Precautions: While a weak antiandrogenic effect has been demonstrated in animals, 'Tagamet' has been shown to have no effect on spermatogenesis, sperm count, motility, morphology or in vitro fertilizing capacity in humans.

In a 24-month toxicity study in rats at dose levels approximately 9 to 56 times the recommended human dose, benign Leydig cell tumors were seen. These were common in both the treated and control groups, and the incidence became significantly higher only in the aged rats receiving 'Tagamet'.

Rare instances of cardiac arrhythmias and hypotension have been reported following the rapid administration of 'Tagamet' HCl (brand of cimetidine hydrochloride) injection by intravenous bolus.

Symptomatic response to 'Tagamet' therapy does not preclude the presence of a gastric malignancy. There have been rare reports of transient healing of gastric ulcers despite subsequently documented malignancy.

Reversible confusional states have been reported on occasion, predominantly in severely ill patients.

'Tagamet' has been reported to reduce the hepatic metabolism of warfarin-type anticoagulants, phenytoin, propranolol, chlordiazepoxide, diazepam, lidocaine, theophylline and metronidazole. Clinically significant effects have been reported with the warfarin anticoagulants; therefore, close monitoring of prothrombin time is recommended, and adjustment of the anticoagulant dose may be necessary when 'Tagamet' is administered concomitantly. Interaction with phenytoin, lidocaine and theophylline has also been reported to produce adverse clinical effects.

However, a crossover study in healthy subjects receiving either 'Tagamet' 300 mg. q.i.d. or 800 mg. h.s. concomitantly with a 300 mg. b.i.d. dosage of theophylline (Theo-Dur®, Key Pharmaceuticals, Inc.),

demonstrated less alteration in steady-state theophylline peak serum levels with the 800 mg. h.s. regimen, particularly in subjects aged 54 years and older. Data beyond ten days are not available. (Note: All patients receiving theophylline should be monitored appropriately, regardless of concomitant drug therapy.)

Lack of experience to date precludes recommending 'Tagamet' for use in pregnant patients, women of childbearing potential, nursing mothers or children under 16 unless anticipated benefits outweigh potential risks; generally, nursing should not be undertaken in patients taking the drug since cimetidine is secreted in human milk.

Adverse Reactions: Diarrhea, dizziness, somnolence, headache, rash. Reversible arthralgia, myalgia and exacerbation of joint symptoms in patients with preexisting arthritis have been reported. Reversible confusional states (e.g., mental confusion, agitation, psychosis, depression, anxiety, hallucinations, disorientation), predominantly in severely ill patients, have been reported. Gynecomastia and reversible impotence in patients with pathological hypersecretory disorders receiving 'Tagamet', particularly in high doses, for at least 12 months, have been reported. Reversible alopecia has been reported very rarely. Decreased white blood cell counts in 'Tagamet'-treated patients (approximately 1 per 100,000 patients), including agranulocytosis (approximately 3 per million patients), have been reported, including a few reports of recurrence on rechallenge. Most of these reports were in patients who had serious concomitant illnesses and received drugs and/or treatment known to produce neutropenia. Thrombocytopenia (approximately 3 per million patients) and a few cases of aplastic anemia have also been reported. Increased serum transaminase and creatinine, as well as rare cases of fever, interstitial nephritis, urinary retention, pancreatitis and allergic reactions, including hypersensitivity vasculitis, have been reported. Reversible adverse hepatic effects, cholestatic or mixed cholestatic-hepatocellular in nature, have been reported rarely. Because of the predominance of cholestatic features, severe parenchymal injury is considered highly un-

likely. A single case of biopsy-proven periportal hepatic fibrosis in a patient receiving 'Tagamet' has been reported.

How Supplied: Tablets: 200 mg. tablets in bottles of 100; 300 mg. tablets in bottles of 100 and Single Unit Packages of 100 (intended for institutional use only); 400 mg. tablets in bottles of 60 and Single Unit Packages of 100 (intended for institutional use only), and 800 mg. Tiltab® tablets in bottles of 30 and Single Unit Packages of 100 (intended for institutional use only).

Liquid: 300 mg./5 ml., in 8 fl. oz. (237 ml.) amber glass bottles and in single-dose units (300 mg./5 ml.), in packages of 10 (intended for institutional use only).

Injection:

Vials: 300 mg./2 ml. in single-dose vials, in packages of 10 and 30, and in 8 ml. multiple-dose vials, in packages of 10 and 25.

Prefilled Syringes: 300 mg./2 ml. in single-dose prefilled disposable syringes.

Plastic Containers: 300 mg. in 50 ml. of 0.9% Sodium Chloride in single-dose plastic containers, in packages of 4 units. No preservative has been added.

ADD-Vantage® Vials: 300 mg./2 ml. in single-dose, ADD-Vantage® Vials, in packages of 25.

Exposure of the premixed product to excessive heat should be avoided. It is recommended the product be stored at controlled room temperature. Brief exposure up to 40°C does not adversely affect the premixed product.

'Tagamet' HCl (brand of cimetidine hydrochloride) Injection premixed in single-dose plastic containers is manufactured for SK&F Lab Co. by Travenol Laboratories, Inc., Deerfield, IL 60015.

* ADD-Vantage® is a trademark of Abbott Laboratories.

How To Avoid Legal Problems

Medical Office Claims Prevention Study; Referral Follow-Through

MEDICAL OFFICE CLAIMS PREVENTION SURVEY

A most productive approach to avoiding problems.

In an effort to reduce their liability exposure, physicians often ask insurance carriers for a profile of the litigious patient. Physicians and other caregivers believe that, armed with this information, they can eliminate such individuals from their practices.

Unfortunately, although some demographic data exists about litigants, there is no meaningful way to predict who will sue. The fact is that every malpractice insurer has had claims filed by individuals from every socioeconomic, ethnic, racial, and financial group, including physicians and other health professionals. No credible studies have been reported which support the allegation that "welfare patients" are more litigious than other more affluent patients. When you consider that plaintiffs' lawyers' fees are a percentage of awards, the patient who cannot claim a wage loss, out-of-pocket expenses, or promising future wages is less likely to attract an attorney's interest in his case.

In search of the so-called litigious patient, physicians in several states have tried to screen potential litigants by computerized tracking of plaintiffs in malpractice suits. For a fee, physicians could call a hotline to check on prospective "bad patients." The plaintiffs' bar countered with a computerized list of physicians named in lawsuits; patients could call the attorneys' hotline for the names of these "bad physicians." The physicians protested, arguing that being sued for malpractice does not necessarily mean that a physician is a bad physician. Using the same logic, the plaintiffs' bar countered that the fact that an individual sues for malpractice does not mean that he or she is a litigious individual who should be blacklisted by the medical community.

In actuality, very few malpractice plaintiffs are pro-

fessional litigants. These hotline wars emphasize the futility of attempting to predict lawsuits by fingering past defendants or plaintiffs. It is more productive to identify the causes of litigation and to develop ways to avoid the problems which prompt suits.

It was on this premise that California's first physician-owned malpractice carrier, Medical Insurance Exchange of California (MIEC), developed its Claims Prevention Survey program for physicians' offices. These office practice surveys draw upon closed malpractice claims data, deposition and courtroom testimony of plaintiffs and medical experts, and the expertise of claims prevention specialists to educate physicians and their staff about the leading iatrogenic causes of claims. The surveys also address nonmedical practice-related issues, including inadequate or inappropriate policies and procedures which trigger litigation.

The surveys do not attempt to evaluate the physicians' medical abilities. MIEC's Liability and Risk Assessment Program in which peer consultants assess a physician's adherence to standards of practice is used for this purpose. The office practice surveys do recognize, however, that not every bad outcome or patient injury results in a lawsuit, and that many litigants who may not have a meritorious claim nevertheless are sufficiently angered by a nonmedical issue to peruse a claim. The surveys focus on identifying and eliminating these problems in individual and group practices.

Methodology. The MIEC Claim Prevention Survey begins with a review by a claims prevention specialist of a random selection of medical charts to analyze the physician's recordkeeping practices. More than 50 documentation factors are considered. Medical judgments are not addressed in this review. Because many malpractice claims are lost or settled because of the poor quality of medical records, in some ways, this is the most important part of the survey process.

Next, the claims prevention specialist meets with the physician for 90 minutes or more to discuss the leading causes of malpractice claims in the doctor's specialty. Pertinent medical-legal issues, such as informed consent, are reviewed, as are the relationship between patient education and medications in litigation. Because the surveyor has reviewed actual medical records and is knowledgeable about malpractice liabilities in the physician's specialty, the office practice survey discussion and the recommendations are quite personalized.

After the conference with the physician, the surveyors meet with the office staff to discuss the many ways they can identify and prevent malpractice liabilities. This is an important step in the survey because it often is the only opportunity that office personnel have to discuss medical-legal topics and to ask questions about their own roles in the office that could have a bearing on possible litigation. Subjects discussed range from patient relations to documentation of what transpired in the patient's visit or call to the office as well as an analysis of medical-legal issues.

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects, respectively.

doctrines, and forms with which allied health professionals must be familiar. Staff documentation, for example, is a process that often is not considered until a lawsuit arises.

The final step in the survey process is an inspection of the office premises to look for obvious and not-so-obvious liability problems. The availability and proximity of emergency equipment, for example, must be considered in some offices as well as the adequacy and safety of laboratory, x-ray facilities, and patient treatment areas.

What physicians learn. MIEC has conducted hundreds of these office practice surveys since 1979. Although most physicians agree to the free voluntary survey, some are initially skeptical about the merits of this approach in reducing malpractice claims. A common reservation is the anticipation that recommendations for change arising out of the survey will be unreasonable, costly, or time-consuming.

Instead, physicians surveyed invariably find that:

1. Better documentation does not mean more documentation.

2. Many office policies and practices that were acceptable in the past are inadequate today and in fact may promote patient injury.

3. The physician most vulnerable to a lawsuit is one who possesses inadequate communications skills and who fails to pass responsibility to patients to follow instructions, seek timely medical attention, and take medications as directed.

4. True "defensive medicine" does not mean ordering unwarranted tests or treatment.

5. The attitude of a physician's office staff may be the catalyst which sends some patients to an attorney in anger when a treatment problem occurs that would not lead other patients to sue.

Mr. David Karp, who regularly writes the material for *Loss Minimizer*, developed and administers MIEC's Claims Prevention Survey Program. (*Medical Liability Monitor*, October 23, 1987, Vol. 12, No. 10)

REFERRAL FOLLOW-THROUGH: IT'S UP TO YOU!

Gaps in the referral process can result in patient injury and litigation against the physicians involved. "I would like you to see a surgeon about your present problem. Why don't you call Dr. Smith for an appointment? Of course, it's your choice; you may already have another surgeon in mind. Just let me know how you make out."

Is this the end of the patient referral process? It should not be! However, in its routine review of cases, the Pennsylvania Medical Society Liability Insurance Company Claims Committee repeatedly has seen the above scenario result in subsequent litigation against the referring physician. The majority of these cases involve allegations of "failure to diagnose or delayed diagnosis/treatment of a patient's condition." Often involving malignancies or cardiac conditions, many of these cases have very high morbidity and mortality outcomes.

Problems arise when a physician recommends referral or consultation in the above manner, leaving the total responsibility for making the referral appointment with the patient. The patient may decide, for whatever reason, simply not to make the appointment. Thus, the physician's good intentions and diagnosis/

treatment plans are foiled and later, a malpractice suit is brought against him/her because the diagnosis or treatment was delayed. While a patient may be found to be contributorily negligent if a delayed diagnosis or treatment can be at least partially attributed to the patient's own delay or failure to see the recommended specialist, juries readily accept the argument that the physician better understands the consequences of a patient's noncompliance.

It is extremely important that the referring physician has some mechanism in place to see that his/her recommendations to the patient are carried out and that the patient indeed was seen by the recommended specialist. The best method for the physician to insure that the recommendation for referral/consultation is carried out is to immediately make the appointment for the patient, in the patient's presence. This way, you will know the appointment has been made and that it will take place in a timely fashion. Additionally, if necessary, the patient can be given any pertinent records information which should be conveyed to the subsequent treating physician. Of course, if time allows, these records can be mailed to the consultant accompanied by a letter describing the patient's condition and the reasons for the referral. If the referral appointment is not made before the patient leaves the referring physician's office, routine office procedure should include some type of followup mechanism to confirm that the recommended appointment was made by the patient.

A physician must convey the appropriate importance, necessity, and urgency behind his/her decision to refer. The patient should be told and understand why the physician is recommending referral to another physician, what you hope to accomplish by the referral, and, to the extent possible, what may happen as a result of the referral—diagnostic testing, hospitalization, or surgery. If the referral means that you no longer will be involved in any aspect of the patient's care, fully explain that to the patient as well. Patient anxiety can be reduced and patient delay or noncompliance usually can be effectively avoided when the patient understands why such a referral is indicated and what to expect. If, in spite of receiving this information, the patient refuses your referral recommendation, be sure to document that the patient was told and understood your referral recommendation as well as the consequences of noncompliance, and still elected not to follow your advice.

Additionally, once the referral is made—whether you are only seeking consultation or are actually turning treatment of the patient over to another physician—it is good practice to followup with the consultant or subsequent treating physician to insure that the patient was seen and to obtain the results of the referral for your records on that patient.

Conversely, if you are acting in the capacity of consultant or a subsequent treating physician, it is your responsibility to communicate the results of your consultation to the referring physician.

Too often, communication gaps in the referral process—be it physician-to-patient or physician-to-physician—can result in patient injury and, ultimately, litigation against the physicians involved in the patient's care. (*Patient Rx Newsletter*, November 1987, Vol. 9, No. 6)

"The Power of the Pen"

When you decide to use Bactrim, use the power of the pen as well. It guarantees your patient will get Bactrim—with the power of penetration where you want it, the power of concentration where you want it, and the power to persist. Three powers well worth trusting.

And remember, after deciding on Bactrim, protect your decision. Take an extra half-second, in accordance with your state regulations, to prevent substitution.

SPECIFY.

Do not Substitute

Bactrim™ DS

(160 mg trimethoprim and 800 mg sulfamethoxazole/Roche)

Bactrim™ Pediatric

(40 mg trimethoprim and
200 mg sulfamethoxazole per 5 ml)

ROCHE®

Please see summary of product information on following page.

Copyright © 1987 by Hoffmann-La Roche Inc. All rights reserved

Before prescribing, please consult complete product information, a summary of which follows:

CONTRAINDICATIONS: Hypersensitivity to trimethoprim or sulfonamides; documented megaloblastic anemia due to folate deficiency; pregnancy at term and during the nursing period; infants less than two months of age.

WARNINGS: FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS.

BACTRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. Clinical signs, such as rash, sore throat, fever, pallor, purpura or jaundice, may be early indications of serious reactions. In rare instances a skin rash may be followed by more severe reactions, such as Stevens-Johnson syndrome, toxic epidermal necrolysis, hepatic necrosis or serious blood disorder. Perform complete blood counts frequently. **BACTRIM SHOULD NOT BE USED IN THE TREATMENT OF STREPTOCOCCAL PHARYNGITIS.** Clinical studies show that patients with group A β -hemolytic streptococcal tonsillopharyngitis have a greater incidence of bacteriologic failure when treated with Bactrim than with penicillin.

PRECAUTIONS: General: Give with caution to patients with impaired renal or hepatic function, possible folate deficiency (e.g., elderly, chronic alcoholics, patients on anticonvulsants, with malabsorption syndrome, or in malnutrition states) and severe allergies or bronchial asthma. In glucose-6-phosphate dehydrogenase deficient individuals, hemolysis may occur, frequently dose-related.

Use in the Elderly: May be increased risk of severe adverse reactions in elderly, particularly with complicating conditions, e.g., impaired kidney and/or liver function, concomitant use of other drugs. Severe skin reactions, generalized bone marrow suppression (see WARNINGS and ADVERSE REACTIONS) or a specific decrease in platelets (with or without purpura) are most frequently reported severe adverse reactions in elderly. In those concurrently receiving certain diuretics, primarily thiazides, increased incidence of thrombocytopenia with purpura reported. Make appropriate dosage adjustments for patients with impaired kidney function (see DOSAGE AND ADMINISTRATION).

Use in the Treatment of Pneumocystis Carinii Pneumonitis in Patients with Acquired Immunodeficiency Syndrome (AIDS): Because of unique immune dysfunction, AIDS patients may not tolerate or respond to Bactrim in same manner as non-AIDS patients. Incidence of side effects, particularly rash, fever, leukopenia, with Bactrim in AIDS patients treated for *Pneumocystis carinii* pneumonitis reported to be greatly increased compared with incidence normally associated with Bactrim in non-AIDS patients.

Information for Patients: Instruct patients to maintain adequate fluid intake to prevent crystalluria and stone formation.

Laboratory Tests: Perform complete blood counts frequently; if a significant reduction in the count of any formed blood element is noted, discontinue Bactrim. Perform urinalyses with careful microscopic examination and renal function tests during therapy, particularly for patients with impaired renal function.

Drug Interactions: In elderly patients concurrently receiving certain diuretics, primarily thiazides, an increased incidence of thrombocytopenia with purpura has been reported. Bactrim may prolong the prothrombin time in patients who are receiving the anticoagulant warfarin. Keep this in mind when Bactrim is given to patients already on anticoagulant therapy and reassess coagulation time. Bactrim may inhibit the hepatic metabolism of phenytoin. Given at a common clinical dosage, it increased the phenytoin half-life by 39% and decreased the phenytoin metabolic clearance rate by 27%. When giving these drugs concurrently, be alert for possible excessive phenytoin effect. Sulfonamides can displace methotrexate from plasma protein binding sites, thus increasing free methotrexate concentrations.

Drug/Laboratory Test Interactions: Bactrim, specifically the trimethoprim component, can interfere with a serum methotrexate assay as determined by the competitive binding protein technique (CBPA) when a bacterial dihydrofolate reductase is used as the binding protein. No interference occurs if methotrexate is measured by a radioimmunoassay (RIA). The presence of trimethoprim and sulfamethoxazole may also interfere with the Jaffe alkaline picrate reaction assay for creatinine, resulting in overestimations of about 10% in the range of normal values.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Carcinogenesis: Long-term studies in animals to evaluate carcinogenic potential not conducted with Bactrim. **Mutagenesis:** Bacterial mutagenic studies not performed with sulfamethoxazole and trimethoprim in combination. Trimethoprim demonstrated to be nonmutagenic in the Ames assay. No chromosomal damage observed in human leukocytes *in vitro* with sulfamethoxazole and trimethoprim alone or in combination; concentrations used exceeded blood levels of these compounds following therapy with Bactrim. Observations of leukocytes obtained from patients treated with Bactrim revealed no chromosomal abnormalities. **Impairment of Fertility:** No adverse effects on fertility or general reproductive performance observed in rats given oral dosages as high as 70 mg/kg/day trimethoprim plus 350 mg/kg/day sulfamethoxazole.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Trimethoprim and sulfamethoxazole may interfere with folic acid metabolism; use during pregnancy only if potential benefit justifies potential risk to fetus. Nonteratogenic Effects: See CONTRAINDICATIONS section.

Nursing Mothers: See CONTRAINDICATIONS section.

Pediatric Use: Not recommended for infants under two months (see INDICATIONS and CONTRAINDICATIONS sections).

ADVERSE REACTIONS: Most common are gastrointestinal disturbances (nausea, vomiting, anorexia) and allergic skin reactions (such as rash and urticaria). **FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS (SEE WARNINGS SECTION).**

Hematologic: Agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, neutropenia, hemolytic anemia, megaloblastic anemia, hypoprothrombinemia, methemoglobinemia, eosinophilia. **Allergic Reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, allergic myocarditis, erythema multiforme, exfoliative dermatitis, angioedema, drug fever, chills, Henoch-Schoenlein purpura, serum sickness-like syndrome, generalized allergic reactions, generalized skin eruptions, photosensitivity, conjunctival and scleral injection, pruritus, urticaria and rash. **Periarteritis nodosa** and systemic lupus erythematosus have been reported. **Gastrointestinal:** Hepatitis (including cholestatic jaundice and hepatic necrosis), elevation of serum transaminase and bilirubin, pseudomembranous enterocolitis, pancreatitis, stomatitis, glossitis, nausea, emesis, abdominal pain, diarrhea, anorexia. **Genitourinary:** Renal failure, interstitial nephritis, BUN and serum creatinine elevation, toxic nephrosis with oliguria and anuria, crystalluria. **Neurologic:** Aseptic meningitis, convulsions, peripheral neuritis, ataxia, vertigo, tinnitus, headache. **Psychiatric:** Hallucinations, depression, apathy, nervousness. **Endocrine:** Sulfonamides bear certain chemical similarities to some goitrogens, diuretics (acetazolamide and the thiazides) and oral hypoglycemic agents; cross-sensitivity may exist. Diuresis and hypoglycemia have occurred rarely in patients receiving sulfonamides. **Musculoskeletal:** Arthralgia, myalgia. **Miscellaneous:** Weakness, fatigue, insomnia.

DOSAGE AND ADMINISTRATION: Not recommended for use in infants less than two months of age.

URINARY TRACT INFECTIONS AND SHIGELLOSIS IN ADULTS AND CHILDREN, AND ACUTE OTITIS MEDIA IN CHILDREN: Usual adult dosage for urinary tract infections is one DS tablet, two tablets or four teaspoonfuls (20 ml) b.i.d. for 10 to 14 days. Use identical daily dosage for 5 days for shigellosis. **Recommended dosage for children** with urinary tract infections or acute otitis media is 8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses every 12 hours for 10 days. Use identical daily dosage for 5 days for shigellosis. **Renal Impaired:** Creatinine clearance above 30 ml/min, give usual dosage; 15-30 ml/min, give one-half the usual regimen; below 15 ml/min, use not recommended.

ACUTE EXACERBATIONS OF CHRONIC BRONCHITIS IN ADULTS: Usual adult dosage is one DS tablet, two tablets or four teasp. (20 ml) b.i.d. for 14 days.

PNEUMOCYSTIS CARINII PNEUMONITIS: Recommended dosage is 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

HOW SUPPLIED: DS (double strength) tablets (160 mg trimethoprim and 800 mg sulfamethoxazole)—bottles of 100, 250 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 20, tablets (80 mg trimethoprim and 400 mg sulfamethoxazole)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40. **Pediatric Suspension** (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 100 ml and 16 oz (1 pint). **Suspension** (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 16 oz (1 pint).

STORE TABLETS AT 15°-30°C (59°-86°F) IN A DRY PLACE PROTECTED FROM LIGHT. STORE SUSPENSIONS AT 15°-30°C (59°-86°F) PROTECTED FROM LIGHT.

THE CHANGING CHARACTER OF CORONARY ARTERY BYPASS GRAFTING

MARK S. HOCHBERG, M.D., ISAAC GIELCHINSKY, M.D., VICTOR PARSONNET, M.D.,
S. MANSOOR HUSSAIN, M.D., DANIEL FISCH, M.S., NEWARK*

Two hundred consecutive patients undergoing coronary artery bypass grafting (CABG) in 1985 are compared to 200 consecutive patients having CABG in 1980 and 1975. Patients undergoing CABG in 1985 were older, more hemodynamically impaired than in 1975 or 1980. Yet, current patients undergo more bypasses per operation with markedly improved survival.

The surgical treatment of coronary artery disease has undergone significant changes since its initial widespread application in the early 1970s. The Veterans Administration Cooperative Study,¹ the European Coronary Surgery Study Group,² and the CASS Randomized Trial³ have attempted to define individuals best suited for medical versus surgical therapy. While these three prospective studies did not reach the same conclusions, they focused surgical attention on the determinants for recommending surgical or medical therapy for the treatment of coronary artery disease.

This report does not deal with the indications for surgical therapy for coronary artery disease. Rather, it compares cohorts of patients referred at three- and five-year intervals for coronary artery surgery. In essence, this report reviews what a large university surgical center actually sees after the referring physicians have screened and determined which patients are suited for coronary artery operation. Cohorts of 200 patients operated upon in 1975, 1980, and 1985 are compared in order to determine their symptomatic and hemodynamic differences at the time of their presentation. Next, changes in operative techniques over the ten-year period are evaluated, and finally, the operative results of these 600 patients are reviewed.

Thus, setting aside the reasons for referral for cor-

onary artery bypass grafting (CABG), this report attempts to determine the effectiveness of CABG as it has evolved from 1975 through 1985.

METHODS AND MATERIALS

The first 200 consecutive patients undergoing solely CABG in 1975 were compared to the first 200 consecutive patients undergoing CABG in 1980, and again to 200 patients undergoing CABG in 1985. Any patient who underwent an associated cardiac procedure such as valve replacement or aortic surgery was excluded from these consecutive patient series. All patients undergoing coronary bypass surgery were included despite the stage of their presentation of disease. Specifically, the series includes "all comers" including individuals operated upon in the midst of myocardial infarctions, those requiring intra-aortic balloon pump support, as well as those admitted electively for bypass surgery. Preoperative evaluation included age, sex, and whether the CABG operation was elective or urgent.

*Drs. Hochberg, Gielchinsky, Parsonnet, and Hussain, and Mr. Fisch are affiliated with the Department of Cardiovascular and Thoracic Surgery, Newark Beth Israel Medical Center, and the Department of Cardiovascular and Thoracic Surgery, UMDNJ. Reprint requests should be addressed to Dr. Hochberg, Newark Beth Israel Medical Center, 201 Lyons Avenue, Newark, NJ 07112.

TABLE 1
Patient Profile

	1975	1980	1985
Patients	200	200	200
Age (years)	52.7 ± .62	57.0 ± .61	59.6 ± .87
Male/Female Ratio	177:23	170:30	155:45

The operation is termed elective if an individual is admitted from home on a prearranged date. An urgent operation is one in which the patient is transferred to our institution from another hospital directly or is considered too ill for discharge to an elective operative status following catheterization. New York Heart Association Class was determined for all patients. The pattern of angina pectoris was characterized as stable or unstable. Prior myocardial infarction was noted. The ejection fraction and the left ventricular end-diastolic pressure (LVEDP) were determined in all 600 patients prior to operation. The requirement for preoperative intra-aortic balloon pump support also was noted. All patients underwent preoperative catheterization and angiography. The number of diseased vessels in all patients was determined.

The operative reports were reviewed. The number of coronary bypass grafts was determined for each patient. In addition, the total time on cardiopulmonary bypass as well as the ischemic time induced by cross-clamp were determined on all patients.

Intermittent aortic cross-clamping at normothermia for the distal anastomoses was utilized in the 1975 cohort of patients. By 1980, a single period of aortic cross-clamping was used along with whole body hypothermia and crystalloid cardioplegia instilled at 4°C to arrest the heart.⁴ The 1985 cohort of patients similarly underwent a continuous period of aortic cross-clamping under hypothermic conditions but blood cardioplegia had replaced the clear cardioplegia. In addition, some patients in the 1985 cohort of patients received an aortic infusion of warm blood

cardioplegia just prior to the removal of the aortic cross-clamp. A bubble oxygenator was used in 1975, but a membrane oxygenator replaced it in the 1980 and 1985 groups.

All postoperative problems were recorded such as perioperative myocardial infarction, arrhythmias, postpericardiotomy syndrome, bleeding, infection, stroke, and renal and pulmonary complications. The requirement for intra-aortic balloon pump to be separated from cardiopulmonary bypass also was noted. Hospital death was defined as death during the operative hospitalization or death within 30 days of the operation, whichever was longer.

Postoperative followup was determined by letter or by a telephone call to the patient or the referring physician. The number of survivors was determined as well as the number of late postoperative myocardial infarctions. A carefully worded questionnaire was used to determine the New York Heart Association Class for all survivors of the operation.

Univariate association of factors was tested via the chi-square statistic, Fisher's exact probability test, and the student's t-test for unpaired sample means. Statistical analyses were done via the ABSTAT* statistical software package.

RESULTS

The 200 patients undergoing coronary artery bypass grafting in 1975 averaged 52.7 ± .62 years of age. In 1980, they averaged 57.0 ± .61 years, and in 1985, they

*IABP: Intra-aortic balloon pump.

TABLE 4
Postoperative Patient Profile

	1975	1980	1985
Patients	200	200	200
Total Followup	86% (171/200)	88% (175/200)	99% (196/200)
12-Month Mortality	2% (4/181)	0.5% (1/190)	2% (4/196)
Overall Mortality	21% (37/171)	5% (8/175)	4% (8/196)
Overall Postoperative Myocardial Infarction	9% (17/171)	2% (4/175)	2% (4/198)
Current New York Heart Association Classification	1.73 ± .12	1.43 ± 1.0	1.20 ± .06

averaged 59.6 ± .87 years of age. The male:female ratio in 1975 was 177:23; in 1980, the male:female ratio was 170:30; and in 1985, the male:female ratio was 155:45 (Table 1).

Preoperative evaluation. The preoperative symptomatic, hemodynamic, and functional data are recorded in Table 2. The comparison of the three cohorts of patients with *P* values is indicated in Table 5. The significant findings are that from 1975 to 1985, the number of patients requiring urgent coronary bypass significantly increased (*P*<.01); more patients presented with unstable angina in 1985 (*P*<.001); and more patients presented with prior myocardial infarction in 1985 compared to 1980 or 1975 (*P*<.001).

Similarly, the ejection fraction and LVEDP were significantly worse for patients undergoing coronary bypass surgery in 1980 and 1985 compared to 1975. The number of diseased vessels was not significantly different among the three cohorts of patients.

Operative Results. The number of bypasses per patient, the characteristics of cardiopulmonary bypass, and the hospital mortality results are indicated in Table 3. The comparison of the patients operated upon in the three periods is shown in Table 5. Over the ten-year period, the number of coronary bypass grafts per patient increased significantly from 2.2 per patient to 3.2 per patient in 1985. The overall cardiopulmonary bypass time decreased. The change in bypass time occurred between 1975 and 1980, with no significant difference since that time. The ischemic time in 1975

was not as long as that in 1980 or 1985. This most probably is due to the fact that intermittent cross-clamp was used in 1975 and continuous cross-clamp using cardioplegic protection was used in the last two groups. Perioperative myocardial infarction significantly decreased over the ten-year period. Requirement for intraoperative intra-aortic balloon pump support was variable but quite small in all three groups. The hospital mortality declined from 10 percent in 1975 to 2 percent in 1980 and 2 percent in 1985.

Postoperative Patient Followup. Followup was achieved in 86 percent of the patients from 1975, 88 percent of the patients in 1980, and 99 percent of the patients operated upon in 1985. The 12-month mortality was 2 percent in 1975, 0.5 percent in 1980, and 2 percent in 1985 (Table 4). The overall (early and late) mortality was 21 percent, 5 percent, and 4 percent, respectively. The overall postoperative myocardial infarction rate decreased significantly from 9 percent in 1975 to 2 percent in 1980 and 2 percent in 1985.

The current New York Heart Association symptomatic classification for patients alive who were operated on in 1975 is 1.73 versus 1.43 in 1980, and 1.2 in patients operated on in 1985. The *P* values from this data are summarized in Table 5.

DISCUSSION

In analyzing the data from 1975 versus 1985—the end of the ten-year spectrum of coronary artery bypass graft surgery—it becomes clear that we now are operat-

*LVEDP: Left ventricular end-diastolic pressure.

**IABP: Intra-aortic balloon pump.

ing upon significantly older individuals and significantly more females than we did in the past. At the time of presentation, patients operated upon in 1985 had far more urgent symptoms and poorer functional capacity as determined by the New York Heart Association Classification. Prior myocardial infarction is much more common in 1985 compared to 1975. This is reflected in the 1985 cohort of patients having a lower ejection fraction, a higher left ventricular end-diastolic pressure (LVEDP), and a more frequent requirement for preoperative intra-aortic balloon pump support. Interestingly, the number of diseased vessels per patient demonstrated at the time of preoperative angiography is not significantly different now versus ten years ago.

Complete revascularization was the rule in 1985 compared to 1975, and this is supported by the significant increase in the number of grafts per patient in 1985 of 3.19 versus 2.17 in 1975. Despite the increased number of grafts, the increased skill gained with experience has decreased the routine pump time significantly. This has resulted in a significantly decreased incidence of perioperative myocardial infarctions. Importantly, the hospital mortality has decreased significantly in the ten-year period probably related to improved skill and better myocardial preservation.

Twelve-month postoperative followup also has shown a decrease in late deaths over the ten-year period, and significant improvement in the postoperative New York Heart Association Class for patients operated upon in 1985 versus 1975.

Data suggest that in 1985 patients referred for CABG have more advanced disease and exhibit greater hemodynamic dysfunction. Nevertheless, the evolution of surgical techniques and surgical ability has more than overcome these differences and has resulted in markedly improved results for the 1985 cohort compared to the 1980 or 1975 cohort.

There are several possible explanations for the worsening of the presenting clinical picture. Whole new classes of drugs such as the calcium channel blockers and the ACE inhibitors have delayed the requirement for surgical therapy in many individuals. Of interest has been the widespread application of percutaneous transluminal coronary angioplasty. Some patients who in 1975 or 1980 would have been referred for CABG now are being treated with angioplasty, thus eliminating these usually better risk patients from the 1985 cohort of patients presenting for CABG. The true impact of angioplasty still is unknown.

The fact that current surgical coronary bypass techniques have decreased morbidity and mortality certainly is not a new observation. Multiple studies have documented improved morbidity and mortality over the past ten years.⁵⁻²⁷

Cosgrove and colleagues reviewed the trends in surgical mortality from primary myocardial revascularization from over 24,000 patients operated upon at the Cleveland Clinic.⁴ In decreasing order of significance, the risk factors for primary revascularization were emergency operation, congestive heart failure, left mainstem disease, female gender, history of congestive heart failure, advancing age, normothermic arrest, number of grafts, poor ventricular function, and incomplete revascularization. While Cosgrove and the

Cleveland Clinic Group have nicely indicated who the higher risk patients are for coronary bypass surgery, it is of interest that as surgeons, we have very little control over who actually presents as surgical candidates for coronary bypass surgery. More precisely, while the patients referred to us surely need operation, in fact, we have no control over a larger, presumably lower risk, population of potential surgical candidates who are not referred for operation. Thus, while we read the large prospective randomized studies with interest, in actuality, they do not define the kinds of patients upon whom we now are operating.

Nonetheless, while we are now seeing patients for operation at a more impaired level of myocardial performance, we are able to achieve better intraoperative and postoperative results than we achieved ten years ago.

CONCLUSIONS

Patients presenting for coronary bypass operation in 1985 are significantly older, require more urgent operation, and have a greater degree of left ventricular impairment than patients presenting for CABG in 1975 or even 1980.

Significantly more coronary bypass grafts per patient, in the setting of improved intraoperative myocardial preservation techniques, are performed now versus 1975 or 1980.

Short-term as well as long-term morbidity and mortality significantly are improved in the 1985 cohort as compared to the earlier cohorts, despite the fact that the 1985 cohort is more symptomatically and hemodynamically impaired.

Specialized ulcer therapy

When advancing age signals reduced acid secretion

If your duodenal ulcer patient is over 55, decreased mucosal resistance is more likely to cause an ulcer than hypersecretion of acid-pepsin.¹ A tendency toward lower acid secretion with advancing age has been shown.^{2,3}

Declining gastric secretion and age³

CARAFATE® (sucralfate/Marion) makes sense as initial ulcer therapy for the elderly. Carafate provides ulcer

healing rates comparable to H₂ antagonists without the risk of systemic side effects or drug interactions—an important benefit for older patients.

The unique, nonsystemic action of Carafate enhances the body's own ulcer healing ability, strengthening the mucosal structure as it protects damaged tissue from further injury.

When advancing age signals reduced acid secretion, choose the specialized ulcer therapy of safe, nonsystemic Carafate.

Nothing works like

CARAFATE®
sucralfate/Marion

1595H7

CARAFATE® (sucralfate)

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that the simultaneous administration of CARAFATE with tetracycline, phenytoin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. The clinical significance of these animal studies is yet to be defined.

Carcinogenesis, Mutagenesis, Impairment of Fertility: No evidence of drug-related tumorigenicity was found in chronic oral toxicity studies of 24 months' duration conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies have not been conducted.

Pregnancy: Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients, adverse effects were reported in 121 (4.7%). Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm pink tablets are supplied in bottles of 100 and in Unit Dose Identification Paks of 100. The tablets are embossed with MARION/1712.

Issued 3/84

SALVAGE PTCA IN PATIENTS WHO ARE NOT CANDIDATES FOR CORONARY SURGERY

RICHARD D. GOULAH, M.D., JONATHAN E. GOLDSTEIN, M.D., JACOB I. HAFT, M.D., NEWARK*

Because PTCA routinely is performed with surgical backup, patients with significant noncoronary disease that contraindicates coronary bypass surgery are excluded. We performed successfully PTCA in two patients with preinfarction angina who were not candidates for bypass surgery.

Percutaneous transluminal coronary angioplasty (PTCA) is a well-recognized procedure which can be utilized as an alternative to coronary artery bypass graft (CABG) surgery in certain patients.¹⁻³ This procedure most often is performed with surgical backup so the patient who suffers unexpected damage to the vessel during PTCA can undergo immediate coronary artery bypass graft surgery to prevent extensive myocardial damage.¹ It generally is felt that only those patients who are candidates for coronary bypass surgery should be allowed to undergo PTCA. Thus, any patients with coronary artery disease and extremely poor left ventricular function and patients with significant noncardiac disease that would make the surgical course difficult or dangerous, usually are excluded from PTCA. The following report demonstrates the utilization of PTCA in two patients with preinfarction angina and significant noncoronary artery disease who were not candidates for surgery.

CASE REPORT 1

A 76-year-old white male was admitted to Saint Michael's Medical Center for intraperitoneal chemotherapy for colon carcinoma with liver metastases. In 1984, evaluation of anemia revealed colon carcinoma, which was resected with end-to-end anastomosis.

Thirty years prior to his present admission, he developed renal infection with transient renal shut down. Shortly after the diagnosis of colon carcinoma was made, he began to develop renal failure and was found to have staghorn calculi. A nephrostomy tube was put in place; however, renal failure increased and he was treated with chronic hemodialysis. Recently, liver metastases were detected by computed tomography scan. He was hospitalized for intraperitoneal chemotherapy with 5 fluorouracil (FU). One month prior to this admission, he initially developed chest pain described as "indigestion" and relieved with eructation. Subsequently, he was pain-free until one week after this admission when he awakened at 2 A.M. with similar chest pain, described as "indigestion," but it radiated to both arms, lasted ten minutes, and was relieved with one sublingual nitroglycerin tablet (NTG). The patient fell asleep but awakened again with chest pain one hour later and again relieved with nitroglycerin. The next day, after eating his lunch and while walking to the bathroom, he developed chest pain which responded to NTG. A cardiology consultation was requested.

*From the Department of Cardiology, Saint Michael's Medical Center, Newark. Correspondence may be addressed to Dr. Haft, Saint Michael's Medical Center, 268 Martin Luther King Jr. Blvd., Newark, NJ 07102.

This patient had no previous history of coronary artery disease, hypertension, diabetes, hypercholesterolemia; the family history of coronary artery disease was negative. He denied the use of tobacco and alcohol. There was no history of paroxysmal nocturnal dyspnea, orthopnea, ankle edema, syncope, near-syncope, or congestive heart failure. Hospital medications included Amphojel®, temazepam, and 5FU; he had received no cardiotoxic medications. Physical examination revealed a well-developed, well-nourished, fully oriented 76-year-old white male in no acute distress. Vital signs were within normal limits: BP = 110/60; P = 80/min and regular; temperature = 98°; and respirations = 16/min. The head, eyes, ears, nose, and throat (HEENT) examination was within normal limits. The neck was supple with no jugular venous distention, thyromegaly, or lymphadenopathy. A right carotid bruit was audible. Lungs were clear. The cardiac point of maximum impulse was in the 5th intercostal space at the mid-clavicular line; the first and second heart sounds were normal and there were no murmurs or gallop rhythm. The abdomen was soft, flat, and nontender with no organomegaly. A nephrostomy tube was in place and an intraperitoneal chemotherapy catheter was present in the lower left abdomen. There was no clubbing, cyanosis, or edema of the lower limbs and peripheral pulses were present. Neurological examination was normal. Electrocardiogram revealed normal sinus rhythm with a rate of 90 and zero axis. There was very minimal ST elevation in the inferior leads with insignificant Q waves. Each bout of chest pain was associated with 2 to 3 mm ST elevation in the inferior leads with tall peaked T waves noted in the anterior leads that reverted to normal with relief of pain. Serum creatine phosphokinase levels remained normal throughout all of the episodes of chest pain. Serum Na⁺, K⁺, and Cl⁻ were normal; BUN was 74 and creatine was 6.5 mg/dl. His serum bicarbonate was 20.8. Hemoglobin was 9.6 gm/d, hematocrit 36.8, and white cell count 13,000. Prothrombin time (PT) and partial thromboplastin time (PTT) were normal. Chest x-ray revealed moderate scoliosis and degeneration of the thoracic spine and stable increased interstitial markings in the right lung base, as compared to previous chest x-rays with a normal cardiac silhouette.

Transdermal nitroglycerin and oral nifedipine, 10 mg every eight hours, were started. On the evening of hospital day 8, the patient again developed retrosternal chest pain; he was transferred to the coronary care unit and treated with intravenous nitroglycerin with prompt control of pain. The following day, we performed coronary arteriography, which revealed hypokinesis of the inferobasal area of the left ventricle. The right coronary artery (RCA) had a 90 percent stenosis in the mid-region; the left circumflex had a 40 percent stenosis in the proximal area, and the left anterior descending artery had a proximal 40 percent lesion. Because of these findings and the ST changes associated with chest pain, we felt that this patient's symptoms were due to the RCA lesion and that he was a potential candidate for balloon angioplasty. However, because of his colon carcinoma with metastases to the liver and chronic renal failure requiring hemodialysis, we felt that surgery could not be justified, and if he went through PTCA, it would be with no surgical

backup. After fully discussing this with the patient and his family and explaining all of the risks, the patient agreed to undergo PTCA. On hospital day 10, the patient underwent successful dilatation of the right coronary artery to approximately 90 percent of luminal size. After an additional 3-day asymptomatic stay in the coronary care unit, he was transferred to a regular care unit where he continued his intraperitoneal chemotherapy and his hemodialysis. The patient was discharged from the hospital after 20 days for outpatient care by his oncologist, nephrologist, and cardiologist.

CASE REPORT 2

An 82-year-old white female was in her usual state of health until three weeks prior to admission when she experienced retrosternal chest pressure radiating to the neck and to the shoulders. It occurred while shoveling snow, but there was no shortness of breath, diaphoresis, nausea, vomiting, lightheadedness, or palpitations. The pain resolved after 30 minutes; she took two aspirin and went to sleep. On awakening the following morning, she experienced similar chest pain with minimal exertion in the kitchen without any associated symptomatology. The pain lasted 10 minutes and was relieved with rest. She was admitted to a community hospital where electrocardiogram revealed inverted T waves in the inferior and lateral leads; cardiac enzymes were normal. While in the hospital, the patient experienced several episodes of chest pain at rest with no further changes on the electrocardiogram and no changes in the cardiac enzymes. The patient was transferred to Saint Michael's Medical Center for coronary arteriography. Medications included heparin, metoprolol, nifedipine, and sublingual nitroglycerin. There was no history of diabetes, hypertension, previous myocardial infarction, hypercholesterolemia, rheumatic fever, heart murmurs, tobacco use, or family history of coronary artery disease. Physical examination revealed a very fragile, fully alert, 82-year-old white female in no acute distress. Vital signs were normal and physical examination was unremarkable except for an S4 gallop rhythm. Coronary arteriography revealed a 99 percent proximal stenosis in the left circumflex artery, a 50 percent stenosis in the mid-region of the right coronary artery, and minimal intraluminal disease in the left anterior descending coronary artery (LAD). The left ventriculogram was normal.

The patient refused to be considered for coronary bypass surgery, but we felt she was an excellent candidate for PTCA. After we explained the risks to the patient, she agreed to PTCA without surgical backup. On hospital day 3, coronary angioplasty with dilatation of the RCA lesion to a near normal intraluminal diameter was performed. After an uneventful three-day stay in the coronary care unit, the patient was transferred to a regular room. When discharged, we prescribed aspirin, dipyridamole, and nifedipine.

DISCUSSION

Patients similar to those reported here are commonly seen in the practice of cardiology and pose an important therapeutic dilemma. The first patient had severe single vessel disease with preinfarction angina that ordinarily would have led to his undergoing PTCA.

However, he also had two additional noncardiac diseases, metastatic colon carcinoma and hemodialysis dependent renal failure, which would make emergency coronary bypass surgery more dangerous and would prolong the recovery period. His expected life span obviously was limited. We felt that coronary bypass surgery should not be performed on this 76-year-old man under any circumstance and the patient and his family agreed. He was willing to accept the risk of PTCA without surgical backup, however, and we felt justified in offering this alternative. The result was excellent.

The second patient was a fragile elderly lady with severe unstable angina and an obvious culprit coronary lesion in an optimum position for angioplasty. Although coronary bypass surgery has been performed successfully in 82-year-old patients, complications, prolonged morbidity, and a poor prognosis for rehabilitation to the premorbid state occur much more frequently in such patients so bypass surgery rarely is pursued in these patients. When this patient refused surgery, we felt that insistence on surgical backup was not justifiable in this patient. After explaining the risks, we performed successful angioplasty with her agreement. We did have a surgeon and blood on hand anyway in case she changed her mind in the event a symptomatic total coronary occlusion occurred.⁴

The incidence of emergency surgery following elective PTCA is approximately 5 to 8 percent; an additional 5 to 10 percent of patients undergo elective surgery because of inability to cross or dilate the coronary lesion.^{1,4} Because of this, elective PTCA is performed only with surgical backup on standby.¹ In both of our patients, the clear-cut symptoms of severely unstable angina appeared to be related to the anatomical findings on coronary arteriography; because of their instability, thallium stress testing appeared dangerous and not warranted. Both patients had received therapy with nitrates, beta blockers, and calcium channel blockers and both remained symptomatic. In both patients, the risk of infarction or death due to their cor-

onary lesions appeared to far exceed the risks of the procedure, even without surgical backup. Hence, with the patient's informed consent, we performed angioplasty. The medicolegal implications of offering PTCA without surgical backup remain unclear. The risks were discussed with the patients and their families and the possibility of death was described frankly. We felt that the alternative, withholding PTCA because surgery was too risky in the first patient or withholding PTCA unless we could convince the second patient to accept a surgical procedure to which she and her family were adamantly opposed, was not in the patient's best interest although it was the safest route for the physicians to take. As noted, with our second patient in whom surgery was not absolutely contraindicated, we typed and crossmatched blood and had a surgeon stand by in the event that the patient changed her mind at the last moment if an emergency occurred.

CONCLUSION

In the future, we expect more patients similar to ours to present themselves to internists and cardiologists. Physicians and patients should realize that PTCA is a modality of therapy that may be offered to informed patients who are not candidates for coronary artery bypass grafting.

New Jersey has eliminated one of the most costly inequities in our tort system... paying claimants twice for the same injury in many cases. Changing the "collateral source rule" has been a major priority of the Medical Inter-Insurance Exchange in its efforts to reform the medical malpractice legal system. The Exchange provided the initiative and leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. It will moderate the ever-increasing severity of insurance losses. A significant victory... but only one step in the Exchange's continuing battle to relieve physicians of unfair burdens.

CASE REPORT: VAGINOGRAPHY FOR COLOVAGINAL FISTULA

DONALD ROTHMAN, M.D., AND PAUL DEDICK, M.D., RED BANK*

Colovaginal fistulas are rare and sometimes difficult to demonstrate. Barium enema often fails to demonstrate the pathology and may be dangerous. Endoscopy fails, but vaginography may visualize enteric fistulas. Radiologic procedures and pathology are described.

Colovaginal fistulas are rare.¹⁻⁴ The pathological etiologies are many and varied. Demonstration of the tract can tax the ingenuity of the radiographer.^{5,6} Visualization of the tract is important for surgical planning. Two cases of sigmoid-vaginal fistulas are presented.

CASE REPORT 1

In December 1983, a 63-year-old woman developed a vaginal discharge which was unresponsive to oral antibiotics. At age 39, she had a two-stage hysterectomy for a pelvic infection and stated that one operation took 14 hours. Vaginal examination disclosed purulent drainage from an opening high in the vagina. Sigmoidoscopy to 20 cm revealed spasm, but no lesions. There was a calculus demonstrated in the left kidney on an otherwise normal intravenous pyelogram. Sigmoid and descending colon diverticulosis was noted on barium enema (Figure 1) and eight days later the patient noted barium and stool coming from the vagina. Vaginography revealed a sigmoid-vaginal fistula (Figure 2). On February 20, exploratory laparotomy disclosed extensive adhesions, cirrhosis of the liver, and a fistula to the vagina from sigmoid diverticulitis. The sigmoid colon and fistula were resected, the vaginal defect was closed, end-sigmoid colostomy was created, and the rectum was stapled by a Hart-

mann's procedure. The patient was discharged two weeks later after recovery from a prolonged ileus. On May 8, 1984, the sigmoid was reanastomosed. She was discharged on May 20, 1984, and did well thereafter.

CASE REPORT 2

A 56-year-old diabetic female was first seen in April 1984, for right leg pain of one year's duration. On the basis of physical examination and Doppler indices, a diagnosis of aortoiliac arteriosclerosis was made. She had a moderate disability until May 1986 when intolerable ischemic pain necessitated aortography and aortobifemoral bypass. End-of-graft to side-of-vessel anastomoses were used and the inferior mesenteric artery was not ligated. Postoperative pain, distention, and diarrhea were at first attributed to antibiotic-induced colitis, but poor response to treatment prompted flexible sigmoidoscopy; biopsy indicated ischemic colitis. She was treated with cecostomy, total parenteral nutrition, and supportive measures, and was discharged one month after the original operation. Diarrhea and vague abdominal pain persisted. Outpatient sigmoidoscopy showed hyperemia, but no ulcerations. Several days later, stool was expelled from the

*Drs. Rothman and Dedick are affiliated with the Departments of Surgery and Radiology, Riverview Medical Center, Red Bank. Correspondence may be addressed to Dr. Rothman, 65 Mechanic Street, Red Bank, NJ 07701.

Figure 1—Extensive diverticulosis on barium enema with no fistula demonstrated.

Figure 2—Fistulous tract (curved arrow) running from vagina (filled with Renografin® via catheter) (straight arrow) to sigmoid diverticulum.

Figure 3—Contrast via catheter in vagina (small arrow) fills fistula (open arrow) and communicates to narrow left colon (large black arrow).

vagina. Vaginography revealed a sigmoid-vaginal fistula (Figure 3). On September 26, exploratory laparotomy revealed the left colon to be rigid, necrotic, and imbedded in the retroperitoneum. It was only possible to do an end transverse colostomy and drainage, but the vaginal fistula could not be identified. Partial slough of the colostomy occurred, but this did not require revision and it functioned satisfactorily with irrigations. The patient has recovered; she eats well, gains weight, and walks without pain.

DISCUSSION

Colonic fistulas are well-described entities and

usually involve the bladder and sigmoid (colosigmoid fistula), but the skin, kidney, pleural space, and other portions of the gastrointestinal tract and vagina can be involved as well.^{3,4,7-9} Pathological etiologies are myriad: diverticulitis, cancer, trauma, abscesses, surgical injury, radiation, and inflammatory bowel disease.

Of course, demonstration of the fistula is important for the surgical correction. Multiple fistulas may exist and the portion(s) of the gastrointestinal tract involved obviously is significant to the surgeon. Localization of the fistula by endoscopy can be disappointing since the opening often is small, hidden in a deep edematous area, or difficult and dangerous to reach because of intestinal narrowing and distortion. Barium enema x-ray often fails to demonstrate the fistula as in the first case because the tract is small, the barium too thick, and not enough pressure can be exerted to fill the channel. Overlapping bowel loops may obscure the fistula. On occasion, the barium enema given to the patient may be contraindicated, dangerous, or not well tolerated.

Vaginography has been described but it is not well known. Our technique is as follows: A No. 24 or No. 26 French 30 cc balloon Foley catheter is inserted into the vagina. Following inflation of the balloon with air, gentle traction is placed on the catheter to assure occlusion of the introitus. Following this, contrast material (Renografin® 60) is introduced through the catheter under fluoroscopic guidance. Thirty ml of contrast material was adequate to demonstrate the abnormality in both cases. The vagina initially was filled with the patient in the supine position and then oblique and lateral projections were obtained to define the exact site of the fistula. The visible mucosal pattern of the intestine was adequate to define whether large or small bowel was involved. An overhead film confirmed the fluoroscopic findings. There were no complications.

Advantages of this method are the simplicity of execution, the ability of the liquid contrast to enter narrow tracts, the sterility of the medium to negate the potential hazard of barium peritonitis, and the avoidance of overlapping bowel encountered with contrast enemas. The use of the Foley balloon to obtain a good seal may be the reason for success here.

information on **The AMA**
prospectuses detailing fees

It still offers you tax-deferral on the money your retirement investments earn.

Whether you already have an Individual Retirement Account or you're just now considering one, here is some timely information for you to consider before April 15th. While your entitlement to an income tax deduction for your 1987 IRA contribution may have changed, there's at least one extremely important reason to either start or retain your Individual Retirement Account:

Very few powerful vehicles remain that offer you income tax deferral on the money your retirement investment earns. And tax-deferral means potential for greater, faster growth for your retirement nest egg.

AMA Advisers, Inc., manager of the mutual funds in **The AMA Group**, wants you to know that in these days of fast-changing markets and amid all the confusion over IRAs since the Tax Reform Act, **The AMA Group** offers you a wide selection of IRS-approved, tax-qualified investment vehicles to meet your own retirement objectives.

The AMA Group also offers you the flexibility to change your investment strategy at a moment's notice, without switching your investment team — and all with a simple toll-free phone call. That's service. And service is what AMA Advisers is all about. We offer you...

- Prompt, accurate, electronic execution of your instructions, and transfer of monies from the bank account you specify...
- Free transfers from one mutual fund to another...
- Low minimum investment...
- Easy-to-read transaction statements...
- Automatic withdrawal plan, and much more.

Don't let the cloud of confusion over today's IRA get in the way of your financially secure retirement. Let AMA Advisers, Inc. help you. Simply complete and mail the coupon for your **FREE** Information Kit on **The AMA Group IRA**. We'll send you important information on your eligibility for IRA tax deductions along with information on all the funds in **The AMA Group**, including prospectuses detailing fees and expenses. Please read the prospectus carefully before you invest or send money.

We're putting lives back together

As a physician you've probably seen it. A family's struggle against alcohol or drugs. A man or woman afraid to ask for help in dealing with depression. A young girl hiding an eating disorder behind a smiling face or popular personality.

At the Carrier Foundation, we work with physicians in treating troubled adolescents and adults. Unlike most general hospitals, all our resources are dedicated to this mission. And have been for more than seventy-five years.

Recognized by all major insurance companies, Carrier is a private, non-profit psychiatric hospital providing both inpatient and outpatient programs. Some of Carrier's specialized programs include: addiction recovery service, adolescent program, affective disorders program, behavioral therapy, eating disorders program, family therapy, geriatric program and women's program.

For more information, call the Carrier Foundation at 1-800-223-0207. The Carrier Foundation. We're putting lives back together.

OPINION: A FEASIBLE SOLUTION

ARTHUR BERNSTEIN, M.D., SOUTH ORANGE*

The author contends that physicians must always remain advocates for patients and give them the best possible medical care—whether they are paid adequately or not.

In a recent article in *NEW JERSEY MEDICINE*, I pointed out the fact that patients did not like to pay for being sick. They wanted their treatment to be cost-free since it was an "act of God" that made them ill.¹

The advent of Blue Cross and Blue Shield, as well as indemnity insurance companies, fostered this attitude. Patients who had coverage no longer wanted to be treated at home. They wanted to go to the hospital because "they were entitled" by dint of the premiums they paid.

The physicians also were paid by the insurance mechanism when the patient was hospitalized, so they lost nothing by this arrangement. That made everything cozy. (This was the beginning of cognitive versus invasive fee differentials). The advent of Medicare also fostered this type of thinking, so all was seemingly a wonderful world for patient and doctor.

But soon the premiums began to rise for Blue Cross and Blue Shield and for the indemnity companies, while their payments to the physician went down for economic reasons. The same situation developed with the federal plans. Thus started the curse of billing for balances, or at times the development of "artful billing" to make up for the cuts. This is when the schism between patient and physician truly began to widen and the patient-doctor relationship began to crumble.

Is this new? No, it is not! We have all seen the famous painting "The Four Stages of the Doctor and Patient" by da Vinci: When the patient is very sick, the doctor is a god. When the patient is getting better, the doctor is an angel. When the patient is well, the doctor is a man. And when the patient receives the bill, the doctor is a devil.

Nothing has changed in this regard except that we were lulled into a sense of security and patient acceptance when our bills were paid by a third party and the patient felt the care was free.

Alas, the honeymoon is over!

Now, what do we do? We join all kinds of groups to protect our rights to "fee for service."

When we lived in small communities or in closely knit neighborhoods, we knew our patients as friends and neighbors, but that is all gone in our larger cities with their scattered suburbs. Thus, we have lost our close rapport with patients and have become suspect like any other "business" or "dealership."

How do we overcome this feeling of "I'm entitled to health care by premiums and I don't need to pay any more." Look at what support for this idea did in Massachusetts. It is obvious that this is the underlying prob-

*Dr. Bernstein is an internist. Correspondence may be addressed to Dr. Bernstein, 514 Longview Road, South Orange, NJ 07079.

lem. But, we must always remain an advocate for our patients, no matter what PRO tells us, or any of the third-party payors set as criteria for fees. We must give the best possible medical care whether we are paid adequately or not at all. We must protect the patient and treat the illness no matter what the rules or fees, or lack thereof, may be. Only then will we be respected and admired as a profession once more.

Will a massive public relations campaign help? I don't think so, based on my discussions with my patients and many others with whom I have met.

Will a relative value scale that the AMA is working on be workable? Yes, it will be if the physicians accept it and if insurance premiums cover it so that there is no additional out-of-pocket expense for the patient. This gives the impression of free medical care which, as I've pointed out, is the goal of the patient.

It is this same desire for "free" medical care that has led to national health insurance in many countries, followed in time by two-tier medicine. In these countries, the physician works for the "system" for eight hours and then has a private practice in the evening for those who are desirous of more personal attention and are willing to pay for it. This seems to work in some places, but do we want that here?

What do we want? "Fee for service" is a nice slogan but what does it really mean? Fifty years ago, when I started in practice, we had fee for service—50¢ for an office visit and \$1 for a house call. Deliveries were \$25. Very often we were not paid at all because people could not afford even these fees. We didn't send out bills for collection or sue them. They were our neighbors! The milieu has changed, and attitudes have changed, but we have not deigned to change our thinking because we liked the "good old days and ways." Let us be realistic and accept the fact that we must change and find acceptable ways to charge for our services, realizing that our patients do not want to pay.

Uwe Reinhardt, Professor of Economics at Princeton University, has made some suggestions; each time I hear him, he is espousing a new method, so the answer

is obviously not a simple one.

Now that I have listed the symptoms and signs of this deep-seated illness and some of the suggested therapies, let us get together and put our collective brains to work and come up with an innovative method that will cure all of our patients and ourselves.^{2,3}

I will make a few suggestions. All government-run plans wind up with a top-heavy expensive bureaucracy. This is not a feasible plan to keep costs down, except at the expense of the patient or the physician or both. All insurance plans, whether they be Blue Cross, indemnity plans, or HMOs, must make a profit to exist, so they too must exist at the expense of the patient or physician, or both.

The answer with which we are left is a well-planned relative value scale agreed upon by all concerned and run by a minimal amount of bureaucratic management. The AMA and others are involved now with the formulation of such a scale. Consideration must be given for balancing so-called cognitive services with invasive technology. In this system, with reasonable premiums, the patients and the physicians once again can establish the rapport that is necessary for good medical management at an equitable cost. It must be a system that Dr. Daniel J. McCarty calls a "zero sum proposition."⁴ In this way, the patient will have minimal premiums and the savings would accrue to patients and physicians, not to bureaucratic machines.

As Thomas Huxley said "If all but you have lost their heads, better take another look."

DONALD F. SMITH & ASSOCIATES

OPINION: PLACING A VALUE ON YOUR MEDICAL PRACTICE

DAVID J. SHUFFLER, HASBROUCK HEIGHTS*

An established, active medical practice is a valuable asset and has a far-reaching impact on the current financial status of a physician as well as future financial and professional goals.

Of all the business transactions a physician encounters during his or her professional career, none seems to cause more confusion or create more uncertainty and anguish than establishing the fair market value of a medical practice.

For the past 20 years, medical practices rarely were bought or sold. The reason was simple: medical expenditures, adjusted for inflation, grew more rapidly than the number of physicians. Each doctor practiced in a world of expanding resources. A new doctor merely opened a practice and patients soon arrived.

Now, spurred by the rapid increase in number of physicians, which is outpacing the growth in medical expenditures, there is a growing market for medical practices. An established, active medical practice is a valuable asset and has a far-reaching impact on the current financial status of a physician as well as future financial and professional goals.

Although the effect of a devalued practice most often is felt by a retiring doctor, all practitioners should be aware of the fair market value of their practices. Personal reasons as well as practice management considerations dictate that a practice appraisal be conducted every five to seven years.

Arriving at an appropriate value for a medical practice is a complex process and an inexact science; rarely can it be made with indisputable precision. The

ramifications cut across contract and tax law, medicine, accounting, marketing, and appraisal.

Calculating the value of the intangible assets of a medical practice is the most critical step in determining total value. Intangibles, which include good will, patient records, and restrictive covenant, could account for as much as 70 to 85 percent of total value. Two variables determine intangible value: the reliability of current earnings and the predictability of future earnings. Market value is the inter-relationship between these variables and it is measured by the capitalized value of cash flow.

Although market value is predicated upon the reliability of current earnings and predictability of future earnings, other factors such as the quality of the revenue-producing patient base and dynamics of the catchment area as well as the fixed cost of conducting practice are important considerations. Perhaps the most significant factor in the valuation formula is the risk of attrition which is a function of the interaction of the quality of the patient base, the medical specialty and maldistribution. In order to minimize attrition, it is essential that the seller work with the buyer during the transition period to retain the patients of record

*Mr. Shuffler is Vice-President, First Jersey National Bank, Hasbrouck Heights. Correspondence may be addressed to Mr. Shuffler, First Jersey National Bank, Heights Plaza, 777 Terrace Avenue, Hasbrouck Heights, NJ 07604.

and maintain services rendered.

The sale of a medical practice is not one sale, but a series of subsales. The sale proceeds must be allocated among the individual assets of the practice with gain or loss computed accordingly. Tax implications should be reviewed carefully with experts because individual income tax strategies as well as the provisions of the tax code of 1986 could alter the after tax proceeds of the sale. Real estate is a separate transaction from the sale of the practice.

In order to maximize market value, a physician must maintain an active, viable practice. Physicians need to plan for the future, work hard, continue to seek and attract new patients, maintain existing equipment, and invest in new technology; a physician also must maintain an informed staff.

The economic changes that have taken place make practice valuation more and more important. The more realistic an appraisal, the more useful the figures will be. Practice valuation is basic to nearly every aspect of

your overall practice and financial planning.

The Medical Society of New Jersey and the Academy of Medicine of New Jersey in cooperation with First Jersey National Bank, held a seminar entitled, "Techniques for Measuring the Value of a Medical Practice," in October 1987. As indicated by the participant evaluations, the workshop was a resounding success. Karl K. Klinges, M.D., stated "I had the opportunity of attending the program covering the value of a medical practice. The program was outstanding with a very practical nuts and bolts presentation made by Mr. David Shuffler of the First Jersey National Bank, on evaluating the greatest asset most of us will ever have. In this age of medicine, I strongly urge all physicians, regardless of their age, to attend future seminars."

This program will be repeated in the near future. Audiocassettes of the program and the workbook/manual are available. Order forms can be obtained by calling Genie Cox at the Academy of Medicine of New Jersey, 609/896-1717.

Trustees' Minutes; UMDNJ Notes; Legislative Bulletin; Physicians Seeking Location in New Jersey

Trustees' Minutes January 17, 1988

A regular meeting of the Board of Trustees was held on January 17, 1988, at the Executive Offices in Lawrenceville. A detailed report is on file with the secretary of your county society. A summary of significant actions follows:

Report of the President . . .

(1) Executive Committee Meeting with Legislative Representatives . . . Was announced that a meeting of the Executive Committee was held with Assemblyman Harold L. Colburn and Speaker Chuck Hardwick to discuss the SCI report, AIDS, Medicaid, tort reform, physician assistants, physical therapists, and nurse practitioners.

(2) Future Meetings . . . Noted the following future meetings: (a) Task Force on AIDS on January 27, 1988; (b) the Committee on Medicaid with Commissioner of Human Services Dr. Drew Altman on January 20, 1988, and Drs. Carnes, Formica, and Malta, Edward F. Meara, III, Clark W. Martin, Mr. Maressa, and Senate President John F. Russo on February 3, 1988; (c) joint meeting of the Executive Committee of MSNJ and New Jersey Hospital Association on January 20, 1988; (d) Drs. Carnes, Formica, and Mineur, Joseph W. Katz, Mr. Maressa, and Chief Justice Wilentz on February 3, 1988, to discuss the proposed amendment of

Rule 4:21, the qualification of medical experts in trial courts, and the discipline of attorneys; and Drs. Carnes, Formica, and Malta, Edward F. Meara, III, Clark W. Martin, Mr. Maressa, and Senate President John F. Russo on February 3, 1988.

Report of Executive Director . . .

(1) MSNJ Paid Membership . . . Noted paid membership as of December 31, 1987, was 7,567.

(2) December 1987 Financial Statements . . . Noted financial statements were unavailable, and would be ready for review in February.

(3) Independent Legal Opinion Regarding PACE . . . Received a report from Gross & Novak, with an independent opinion regarding legal ramifications of the PACE and Medallion programs offered by Blue Cross and Blue Shield.

(4) SCI Update . . . Noted that proposed legislation is being drafted by Judge Stern in the matter of the SCI Report on the Impaired Physicians Program.

(5) Reinsurance Association Surcharge . . . Voted unanimously to support and continue MSNJ's position that those physicians who created the losses of the Reinsurance Association (1977-1982) should pay the annual 4 percent surcharge being proposed by the Commissioner of Insurance.

NJ Hospital Association . . . Voted to continue its present position in support of the NJHA, and to refer the entire issue to the Council on Medical Services for study and advice. Note: MSNJ endorsed the position of NJHA for an increase in the base rate of reimbursement to hospitals to provide quality care for the citizens of New Jersey and agreed to contact the Hospital Rate-Setting Commission.

New Business . . .

(1) Massachusetts Medical Society Council Resolution . . . Defeated a motion to send a copy of the Massachusetts Resolution to the members of the legislature; the Resolution stated, "The Massachusetts Medical Society considers the Commonwealth of Massachusetts an undesirable location in which to practice." Note: The reason for the Resolution was that the over-regulation of medical practice in Massachusetts is driving quality health care

and the physicians who provide it, out of state.

(2) Boyd versus St. Joseph's Hospital . . . Noted that the vote was not in favor of appearing as amicus curiae in this case; the case centers around the rule of the hospital's medical board that physicians must become board certified by their primary specialty board within four years to maintain hospital privileges.

UMDNJ Notes

**Stanley S. Bergen, Jr., M.D.
President**

Two years ago, Governor Thomas Kean urged UMDNJ to become one of the top 25 academic health science centers in the United States. His challenge immediately became our rally cry, and the top 25 effort has developed into the foundation for all of our institutional initiatives.

We have studied the matter extensively during the past two years, and those studies continue. We have developed a much clearer understanding of the characteristics of a first-class health sciences institution, and we've begun to determine what we must do to develop those characteristics. In January, during my annual State of the University address, I was able to announce for the first time our best estimate of the pricetag for success in the Top 25 effort.

We believe we will need some \$650 million over the next decade—over and above our current budget—if we are to provide New Jersey with a world-class facility for health professions education, health service delivery, and biomedical research. This money would come from state appropriations, federal grants, fundraising efforts in the private sector, and faculty practice and other self-generated income. But the money must begin to flow soon, or the window of opportunity will close.

The linchpin of any first-rate research university is a large and prestigious faculty. Much of the new money will go toward vastly increasing the size of our faculty, and toward recruiting some of the most prominent scientists in the world to our campuses.

The need for more faculty creates a need for more space. As mundane as it may sound, physical space could be the single most fundamen-

tal impediment to our top 25 aspirations. Space right now is a crisis issue for our present faculty, to say nothing of the adverse impact on our critical future recruitment efforts. It is the numbers of faculty; the importance and diversity of their work; their reputations; and the significant dollars that both they and their programs attract that will enable the kind of system we are talking about to fall into place and to develop a degree of self-reliance.

UMDNJ's recruitment effort during the past two years has begun to "snowball," and a number of prominent individuals have expressed interest in following their colleagues to the University. It is a shame that we cannot now welcome them because of space limitations.

In specific terms, here is how we propose to invest that \$650 million:

- Hire at least 400 new additional faculty members and 700 support personnel, such as technicians and graduate fellows, over the next decade.

- Fill 15 key leadership positions at the dean and department chair levels with individuals who have national and international reputations.

- Construct new research towers and clinical services buildings, amounting to some 400,000 square feet, at the Newark and Piscataway campuses.

- Continue to develop and refine specialized "centers of excellence" in such areas as biotechnology, environmental and occupational medicine, liver transplantation and related diseases, cancer, kidney disease, Alzheimer's and other ailments of aging, reproductive medicine, and heart disease.

Making it to top 25, however, will require more than dollars. The University will need enhanced governance and flexibility to remove impediments that prevent us from seizing opportunities and undertaking new challenges in a timely manner; and recognition of the special roles and missions of the University's core teaching hospitals—and certain other affiliate hospitals—through rate relief for medical education and special consideration for certificate of need and other regulatory processes.

We intend to pursue the Top 25 agenda as vigorously as we know how for the UMDNJ.

Legislative Bulletin

S-1276-Contillo—Tobacco Sales to Minors. Prohibits the sale of tobacco and tobacco products to minors. **Approved.**

S-2137-McManimon—Health Planning. Creates a "local health planning" system to operate the certificate of need apparatus. The agencies would be funded by a special tax on hospitals. **Active Opposition;** MSNJ is opposed to governmental mandated health planning.

S-2387-DiFrancesco—Temporary Disability. Protects pregnant workers and others by providing mandatory job guarantees and health benefits for up to 26 weeks in a given year. **No Action.**

S-2392-DiFrancesco—Temporary Disability. Provides that parents of newly born, adopted, or seriously ill children will be entitled to leave from employment and guarantees employment security. Protected leave would be 26 weeks in a 24-month period. **No Action.**

S-2424-Codey—Pharmacy (same as A-2559). Prohibits certain health care institutions from conducting a retail pharmacy. **Active Opposition,** in accordance with Board of Trustees' actions (April 12, 1987). This bill is anti-consumer and detrimental to the future efforts of hospitals and physicians to diversify services in order to meet cost containment goals.

S-2960-Ewing—AIDS. Requires persons suspected of venereal disease to submit to HLTIV-III tests; requires applicants for marriage licenses to be tested and the physician to notify them in writing of the results on a form developed by the Department of Health; requires physicians to certify that they have tested applicants and notified them of the results. **Action Deferred,** pending further information from MSNJ's AIDS/HIV Task Force.

S-3009-Dalton—Emergency 911. Provides for planning and implementation of a 911 system throughout the state. **Conditional Approval,** pending amendment to the bill that would transfer the financing mechanism from community business phone users to the state government.

S-3013-McNamara—Medicaid. Expands the medically needy program to cover inpatient care. **Approved.**

S-3019-Pallone—Ocean Environment. Calls for the Department of Health and the Department of Environmental Protection to undertake a health impact study on New Jersey coastal waters; appropriates \$1 million for the study. **Approved.**

S-3164-Lesniak—Medical Licensure. Deletes the requirement that physicians attend at least two years of college. **Disapproved,** because the existing statute that applies to educational requirements in New Jersey should not be weakened.

S-3170-Dorsey—Political Contributions (same as A-4374). Limits PAC contributions to \$2,500 per candidate per calendar year. **No Action.**

S-3177-Rand—Prescription Drugs. Prohibits mail order prescription drugs in state employee programs. **Conditional Approval,** pending amendment to the bill that would prohibit mail order drug

dispensing unless they comply with all New Jersey drug dispensing regulations.

S-3233-Ewing—AIDS. Requires inmates in correctional institutions to be tested for AIDS. **Action Deferred,** pending further information from the AIDS/HIV Task Force.

S-3256-Cardinale—Healthy Lifestyles. Requires health insurers to give financial incentives for healthy lifestyles under insurance contracts and to offer wellness plans approved by the Commissioner of Insurance and Commissioner of Health. **Conditional Approval,** pending amendment to include periodic health care examinations.

S-3284-Zimmer—Emergency Medical Technicians. Permits emergency medical technicians (EMT) certified by the Commissioner of Health as an EMT-D to perform cardiac defibrillation. **Active Support.**

S-3288-Bassano—Audiologists. Deletes the requirement that audiologists and speech therapists must pass a national examination. **Action Deferred,** pending further information from the New Jersey Academy of Ophthalmology and Otolaryngology.

S-3302-Feldman—Surrogate Parenting. Establishes a commission to study surrogate parenting. **Conditional Approval,** pending inclusion of MSNJ-appointed physician on the Commission.

S-3320-McManimon—Nursing Supply. Creates a commission to study the nursing supply problem; no medical representation is included. **Conditional Approval,** pending inclusion of physician on Commission.

S-3352-VanWagner—Civil Immunity. Grants civil immunity to counselors and psychotherapists for disclosing a patient's potential for violence in certain situations. **Conditional Approval,** pending inclusion of physician in psychotherapy section of bill.

S-3381-Zane—Auto Insurance. Provides for certain amendments to the no-fault law. Establishes a medical fee schedule that incorporates the fees of 90 percent of the practitioners within a given region. **No Action.**

S-3390-Rand—Southern New Jersey Children's Hospital. Designates Cooper Hospital as the "Southern New Jersey Children's Hospital" provided a majority of the acute care hospitals providing inpatient pediatric care in southern New Jersey agree to refer to Cooper. (This bill substituted by A-4073.) **Approved** (letter to Governor and sponsor of the bill, regarding obvious defect in DRG system.)

S-3414-McManimon—AIDS. Requires that funeral directors be notified in writing if a patient had a communicable disease which requires that precautions be taken. **Conditional Approval,** pending amendment to assure confidentiality of information by the funeral director.

S-3429-Dalton—Medical Fee Schedule (Auto Insurance). Provides that the Commissioner of Insurance shall promulgate a fee schedule at the 90th percentile. The schedules are to be reviewed biannually. **No Action.**

S-3475-Ambrosio—Recovery of Burial Expenses. Provides that

noneconomic damages in the wrongful death of a minor shall be limited to \$100,000. **Action Deferred**, pending further information from the Medical Inter-Insurance Exchange.

S-3482—AIDS. Requires the Department of Health to adopt rules to assure that hospitals accept their fair share of patients with AIDS or ARC. **No Action.**

S-3498—Cardinale—Osteoporosis (same as A-3707). Creates a 15-member Commission to study services to patients with osteoporosis; five of the members shall be health care professionals. **No Action.**

S-3500—McManimon—Disability Determinations (same as A-4465). Allows psychologists to certify disability. **Active Opposition**, the determination of disability certification is a medical decision.

S-3510—Dalton—Emergency Medical Services. Extends the Emergency Medical Services Study Commission another four months; the Commission in its first phase report has recommended a state-wide 911 system. **Approved.**

S-3518—Haines—HMO. Provides that if an HMO and a contracting health care facility do not renew their contract, it shall remain in force for four months following the contract expiration date in order to allow enrollees the opportunity for normal transition. **Conditional Approval**, pending an amendment to provide that the same notification be forwarded to providers as well as enrollees.

S-3633—Lipman—"Wellness". Requires health insurers to offer wellness incentives. **No Action.**

S-3651—DiFrancesco—Involuntary Commitments. Assures patients in short-term psychiatric facilities and screening services certain civil rights. **Action Deferred**, pending further information from MSNJ's Council on Mental Health.

S-3682—Gormley—Medical Waste Disposal. Imposes strict liability on hospitals and health care facilities for the damages caused by the discharge of waste into the ocean or fresh waters of the state. **Action Deferred**, pending further information from MSNJ's Council on Public Health and the Medical Inter-Insurance Exchange of New Jersey concerning the joint and several liability referred to in the bill statement.

S-3696—McManimon—Local Health Planning. Appropriates \$650,000 to fund local health planning. **Active Opposition**, mandated planning has not proved effective and should not be continued. Eleven states plus the federal government have deleted it.

A-2559—Felice—Pharmacy (same as S-2424). Prohibits institutions from operating retail pharmacies within 1,500 feet of their facility. **Active Opposition**, in accordance with Board of Trustees' actions (April 12, 1987). This bill is anticonsumer and detrimental to the future efforts of hospitals and physicians to diversify services in order to meet cost containment goals.

A-2682—Stuhltrager—Minors. Prohibits the sale of tobacco to minors. **Approved.**

A-3079—Paterniti—Temporary Disability. Provides that jobs of persons on

temporary disability must be protected for 26 weeks. **Disapproved**, this bill would have a significant adverse impact on small businesses.

A-3081—Cattrillo—Temporary Leave. Provides that positions of parents of seriously ill children may take protected leave of up to 26 weeks within a two-year period. **No Action.**

A-3683—Martin—Nursing Education. Directs Rutgers to establish a doctoral program in nursing. **Disapproved**, the trustees of the University should determine what degrees should be offered.

A-3707—Paterniti—Osteoporosis (same as S-3498). Establishes a commission (15 members) to compile and analyze data on osteoporosis, develop educational programs, and assist local health agencies in public education. **No Action.**

A-3711—Zecker—No Fault. Amends the no-fault law in several areas; requires carriers to conduct utilization review and to engage in managed care. **Disapproved**, third-party carriers are denying patients access to needed care; this legislation would aggravate that situation.

A-3719—Cooper—Withholding or Withdrawing Treatment in Terminal Illness. Allows competent adults to issue a directive that provides they shall not be artificially sustained during a terminal

condition. No definition is provided for terminal condition. **Action Deferred**, pending report of the Governor's Commission on Biomedical Ethics.

A-3724—Cattrillo—AIDS. Requires the Department of Health to institute a mobile educational program on AIDS for intravenous drug users. **Action Deferred**, pending further information from MSNJ's HIV/AIDS Task Force.

A-3725—Singer—Child Abuse. Establishes a child abuse diagnostic center in southern New Jersey. **Approved.**

A-3744—Ogden—Communicable Disease. Requires health care facilities to notify first aid, ambulance, or rescue squads that the patient they are transporting has a communicable disease when that fact is known to the facility. **Approved.**

A-3751—Loveys—Structured Payments in Tort (same as A-4615). Requires structured payments when future damages exceed \$200,000 by means of an annuity contract. **Active Support.**

A-3754—Doyle—Emergency Services. Requires volunteer emergency personnel to be certified either through the State First Aid Council or the Department of Health. **Approved.**

A-3777—Colburn—Certificate of Need (CON). Allows hospitals to undertake outpatient projects costing no more than

MEDICAL SOCIETY OF NEW JERSEY ANNUAL MEETING

April 27-May 1, 1988

Sheraton Meadowlands Hotel
East Rutherford

Proposed Daily Schedule

Wednesday, April 27, 1988

3:30 p.m.—Board of Trustees' Meeting

Thursday, April 28, 1988

9:00 a.m.—Registration Opens
9:00 a.m.—Message Center Opens
2:00 p.m.—House of Delegates
3:30 p.m.—Reference Committees

Friday, April 29, 1988

8:00 a.m.—Registration Opens
8:00 a.m.—Message Center Opens
8:30 a.m.—Exhibits Open
9:00 a.m.—House of Delegates (election)
12:00 noon—Golden Merit Award Ceremony followed by Reception
2:30 p.m.—Reference Committees
5:00 p.m.—JEMPAC Political Forum
5:45 p.m.—JEMPAC Wine and Cheese Reception

Saturday, April 30, 1988

8:00 a.m.—Registration Opens
8:00 a.m.—Message Center Opens
8:30 a.m.—Exhibits Open
9:00 a.m.—House of Delegates
1:30 p.m.—House of Delegates
6:00 p.m.—Inaugural Reception followed by Inaugural Dinner

Sunday, May 1, 1988

8:00 a.m.—Registration Opens
8:00 a.m.—Message Center Opens
8:30 a.m.—Program on one topic of major interest to the physician
1:00 p.m.—Board of Trustees' Meeting

\$2,000,000 without obtaining a certificate of need. **Active Support.**

A-3801-Kline—AIDS (Health Insurance). Prohibits the denial of insurance to persons with AIDS. **Action Deferred,** pending further information from MSNJ's HIV/AIDS Task Force.

A-3817-Kline—AIDS (Funeral Directors). Requires doctors, nurses, or the medical examiner to notify the funeral director in writing if the decedent had or was suspected of suffering from a communicable disease. **Conditional Approval,** pending amendment to assure confidentiality of information by the funeral director; refer to MSNJ's HIV/AIDS Task Force.

A-3865-Kosco—Prosthetists and Orthotists. Licenses and regulates prosthetists and orthotists through a multidisciplinary professional board with the Division of Professional Boards. **Disapproved,** there is no indication that public interest will be served by licensing these technicians.

A-3882-Moran—Prescription Drugs (same as S-3177). Prohibits mail order prescription drugs in any state benefits program for public employees. **Conditional Approval,** pending amendment to the bill that would prohibit mail order drug dispensing unless they comply with all New Jersey drug dispensing regulations.

A-3933-Felice—Medicaid. Increases fees for professional health services to Medicaid recipients by 10 percent. **Conditional Approval;** Medicaid fees are an embarrassment and should be raised to the level of Medicare.

A-3935-Singer—Medicare. Requires the Commissioner of Health to study the senior medical courtesy program and to file a report by January 1, 1988. **No Action.**

A-3948-Kline—AIDS Reporting. Requires that patients with positive HTLV III be reported to the Department of Health within 72 hours. The Department shall institute contact tracing. All information is to be confidential. **Action Deferred,** pending further information from MSNJ's HIV/AIDS Task Force.

A-3965-Pelly—Impaired Professionals. Directs the Boards responsible for licensing certain but not all health professionals to institute impaired professional programs. Professional societies would contract with the respective boards to administer the program. There are no details regarding qualifications of personnel or funding. **No Action.**

A-3995-Gargiulo—Suicide (Elderly). Creates a 13-member commission to study the problem of suicide among the elderly. **Disapproved,** there are other sectors of our Society that have a suicide rate higher than the elderly—to be meaningful, the study should include all ages.

A-4001-Collins—Nursing Supply (same as S-3320). Creates a commission to study the nursing supply problem; does not include physician representation. **Conditional Approval,** pending inclusion of physician on Commission.

A-4013-Otlowski—Mental Health. Assures persons receiving treatment on

an involuntary basis in either a screening service or short-term facility of the same rights as patients who have been involuntarily committed to state or county psychiatric facilities. **Action Deferred,** pending further information from MSNJ's Council on Mental Health.

A-4043-Albohn—Audiologists. Deletes the requirement that audiologists and speech pathologists must pass a national examination. **Action Deferred,** pending further information from the New Jersey Academy of Ophthalmology and Otolaryngology.

A-4069-Kern—AIDS. Provides that anyone with AIDS who knows of their infection and commits an act of sexual penetration is guilty of a crime of the third degree. **Action Deferred,** pending further information from MSNJ's HIV/AIDS Task Force.

A-4073-Bryant—Southern New Jersey Children's Hospital (same as S-3390). Designates Cooper Hospital as the "Southern New Jersey Children's Hospital" provided a majority of the acute care hospitals providing inpatient pediatric care in southern New Jersey agree to refer to Cooper. (**Law c.299 (1987).**)

A-4119-Zecker—County Medical Examiners. Requires the state to finance the county medical examiner system. **No Action.**

A-4138-Kavanaugh—Surrogate Parenting. Prohibits the payment of money for surrogate parenting expenses. **No Action.**

A-4161-Kavanaugh—Alcoholism and Drug Abuse. Creates a Governor's Council on Alcoholism and Drug Abuse. The Council will be the single state agency for alcohol and drug abuse; coordinate all state educational programs; develop and implement a master plan for treatment, prevention, research, and education. The Council will be in but not "of" the Department of Health. **Action Deferred,** pending further information from MSNJ's Committee on Drug and Alcohol Abuse; refer to MSNJ's HIV/AIDS Task Force.

A-4171-Kern—Council on Alcoholism and Drug Abuse. Similar to but not identical to A-4161. Does not reorganize the current agencies in state government as does A-4161. **Action Deferred,** pending further information from MSNJ's Committee on Drug and Alcohol Abuse. Refer to MSNJ's HIV/AIDS Task Force.

A-4182-Deverin—Medicaid. Extends Medicaid benefits for one year for employed patients after they have left Aid to Families with Dependent Children (AFDC) eligibility. (**Law c.283(1987).**)

A-4249-Villane—Environment. Requires the state government to study the health effects of chlorinated sewage in coastal waters. **Approved.**

A-4316-Randall—Adolescent Drug and Alcohol Abuse. Requires the Commissioner of Health to establish a 15-member task force to study and make recommendations regarding regulations for drug and alcohol treatment programs for adolescents. **Action Deferred,** pending further information from MSNJ's Committee on Drug and Alcohol Abuse.

A-4334-Colburn—HMO Contracts

with Health Care Facilities. Provides that in the event that an HMO and a general hospital or other health care facility with which the HMO has a contract to provide services to its enrollees, are unable to agree on the terms of a new contract upon the expiration of the current contract, the health care facility and the HMO shall continue to abide by the terms of that contract for a period of four months from the date of expiration of the contract, during which time an enrollee of that HMO who has been receiving services from the health care facility under the terms of the previously existing contract may terminate his enrollment in the HMO and purchase health care benefits from another provider or insurance carrier. **Conditional Approval,** pending an amendment to provide that the same notification be forwarded to providers as well as enrollees.

A-4361-Kline—AIDS. Makes it a crime of the fourth degree for state employees to make an unauthorized disclosure of AIDS reports which have been submitted to the Department of Health. **Action Deferred,** pending further information on unauthorized disclosures.

A-4374-Donovan—Political Contributions (same as S-3170). Limits PAC contributions to \$2,500 per candidate per calendar year. **No Action.**

A-4432-Zecker—Civil Immunity. Permits certain nonprofit corporations to extend immunity to trustees, directors, officers, members, or employees when exercising judgment or discretion. **Approved.**

A-4435-Palaia—Emergency Medical Services (EMS). Appropriates \$1,500,000 to fund a statewide EMS network. **Approved.**

A-4465-Penn—Psychologists. Permits psychologists to certify disability under the temporary disability benefits law. **Active Opposition,** the determination of disability certification is a medical decision.

A-4466-Loveys—Joint and Several Liability. Eliminates joint and several liability except for environmental torts. **Active Support.**

A-4484-Rafferty—Collateral Sources of Income. Requires that collateral sources other than workers' compensation or life insurance shall be offset in personal injury actions. **No Action.**

A-4497-Villane—Medical Waste. Amends the hazardous waste act to include medical waste. **Action Deferred,** pending further information from MSNJ's Council on Public Health.

A-4515-Kern—Health Planning. Appropriates \$650,000 to fund local health planning. **Active Opposition,** mandated planning has not proved effective and should not be continued. Eleven states plus the federal government have deleted it.

A-4551-Deverin—Medicaid Fiscal Intermediaries. Provides that health service corporations and dental service corporations can qualify as intermediaries under Medicaid. **Approved.**

A-4615-Loveys—Structured Payments (same as A-3751). Provides for structured payments of future damages exceeding \$200,000. **Active Support.**

AR-141-Singer—Senior Medical Courtesy Program. Commends the Union and Ocean County Medical Societies for their senior medical courtesy programs. **Active Support.**

AR-143-Farragher—Medicare Fees. Requests Congress to raise fees to doctors participating in Medicare. **Active Support.**

AR-156-Kalik—Medicare — Catastrophic Illness. Requests Congress to provide Medicare recipients with catastrophic illness coverage. **Active Support.**

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ANESTHESIOLOGY—Daniel O'Brien, M.D., 12 Beech Dr., Brunswick, ME 04011. Liege (Belgium) 1975. Board certified. Group, partnership, solo. Available.

ENDOCRINOLOGY—Alex Stewart Stagnaro-Green, M.D., 228 Voorhis Ave., River Edge, NJ 07661. Mount Sinai 1983. Also, internal medicine. Board eligible. Board certified (IM). Partnership, group, solo. Available July 1988.

FAMILY MEDICINE—William B. Glenn, D.O., 2 Raintree Way, Havelock, NC 28532. Philadelphia College 1980. Board certified. Group, partnership, solo. Available July 1988.

GASTROENTEROLOGY—Joel H. Kurtz, M.D., 2600 Netherland Ave., Apt. 2811, Riverdale, NY 10463. UMDNJ 1983. Board eligible. Partnership or group. Available July 1988.

HEMATOLOGY—Marta Meyers, M.D., 128 Hempstead Ct., Madison, NJ 07940. Medical College of Pennsylvania 1981. Also, internal medicine. Board certified. Group or partnership. Available.

INTERNAL MEDICINE—Robert P. Beswick, M.D., 2316 W. Cortez St., Chicago, IL 60622. Illinois 1981. Board certified. Group, partnership, clinic, industry. Available.

Glenn A. Dubov, M.D., 75-36 Bell Blvd., Apt. 2A, Bayside, NY 11364. Chicago 1983. Board certified. Also, nephrology. Group or partnership. Available July 1988.

Kathy Rosen Kerr, M.D., 318 Perrine Ave., Piscataway, NJ 08854. UMDNJ 1984. Also, pediatrics. Board eligible. Partnership or small group. Available July 1988.

Daniel R. Massarelli, M.D., 98 Longfellow Rd., Worcester, MA 01602. Georgetown 1985. Board eligible. Group, partnership, solo. Available September 1988.

Marta Meyers, M.D., 128 Hempstead Ct., Madison, NJ 07940. Medical College of Pennsylvania 1981. Also, hematology. Board certified. Group or partnership. Available.

Leilani L. Nixon, M.D., 1175 Gail Dr., Buffalo Grove, IL 60089. Illinois 1985. Board eligible. Partnership or solo. Available July 1988.

Sarva Daman Singh, M.D., 26 Carlson Ct., Closter, NJ 07624. Agra (India) 1978. Board eligible. Group or partnership. Available March 1988.

Samuel J. Stepanow, M.D., 430 W. Browning Rd., Apt. S-5, Bellmawr, NJ 08031. Hahnemann 1985. Board eligible. Group or partnership. Available July 1988.

Darius Sypek, M.D., 154 Oakwood Ave., Apt. 3, Cliffside Park, NJ 07019. Medical Academy (Poland) 1984. Board eligible. Group. Available July 1988.

Alex Stewart Stagnaro-Green, M.D., 228 Voorhis Ave., River Edge, NJ 07661. Mount Sinai 1983. Also, endocrinology. Board certified. Board eligible (ENDOCRIN). Partnership, group, solo. Available July 1988.

NEPHROLOGY—Glenn A. Dubov, M.D., 75-36 Bell Blvd., Bayside, NY 11364. Chicago 1983. Also, internal medicine. Board certified (IM). Group or partnership. Available July 1988.

How to get to the Sheraton Meadowlands

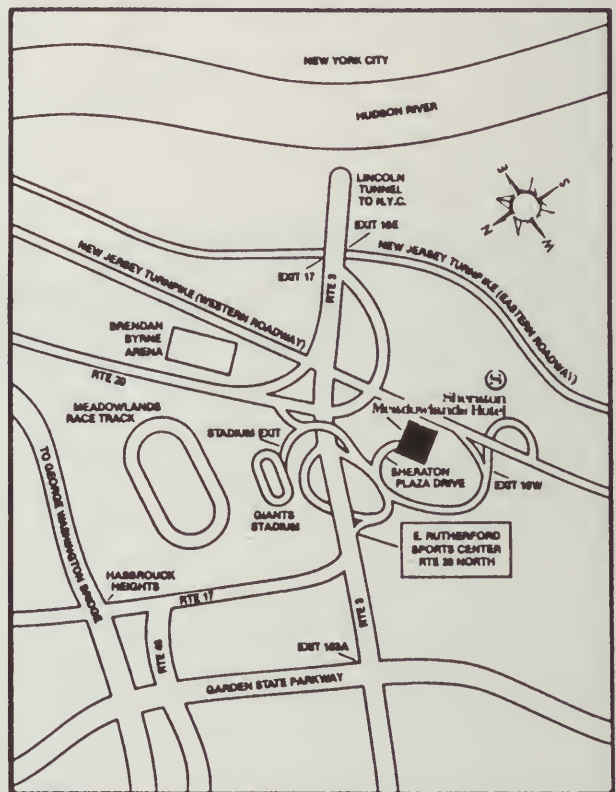

From New York via Lincoln Tunnel: Route 3 W to Sheraton Plaza Drive exit; follow signs to hotel.

From New Jersey Turnpike (N or S): Exit 16 W; follow signs to Route 3 E; stay on service road and follow signs for Sheraton Plaza Drive.

From New York via G. W. Bridge: Take I-95 (N.J. Turnpike) S; exit 16 W and follow as above.

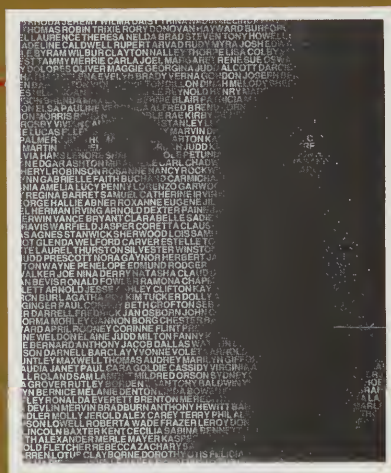

From Garden State Parkway (N or S): Exit 153A to Route 3 E to Route 20 N (Arena) exit; follow signs for Sheraton Plaza Drive.

From Route 17 (N or S): Exit Route 3 E and follow as above.

EXPECT YOUR NEXT PATIENT ON INDERAL[®] LA TO...

(PROPRANOLOL HCl)
LONG ACTING CAPSULES 60, 80, 120, 160 mg

Feel Like a

MILLIONAIRE

ON

...like the more than one million patients who have received **INDERAL® LA**.

In a recent survey, 4,120 participating physicians gave us their views¹ on **INDERAL LA** in the treatment of hypertension, angina and migraine.

INDERAL LA is their preferred beta blocker

...of the nearly three out of four physicians responding to the questionnaire, an impressive 97% rated **INDERAL LA** good to excellent for overall performance. Virtually all cited efficacy, tolerability, long-term cardiovascular protection and once-daily convenience as important factors in their choosing to prescribe **INDERAL LA**.

INDERAL LA promotes patient compliance

...Virtually every responding physician rated patient satisfaction with **INDERAL LA** to be as good as, or better than, other beta blockers.

Like conventional **INDERAL** Tablets, **INDERAL LA** should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree and bronchial asthma.

60 mg 80 mg 120 mg 160 mg

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION, SEE PACKAGE CIRCULAR.)

INDERAL[®] LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. Inderal LA is formulated to provide a sustained release of propranolol hydrochloride. Inderal LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. Inderal is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by Inderal, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

Inderal LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with Inderal LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of Inderal Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

Inderal LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to Inderal LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, Inderal LA has been therapeutically equivalent to the same mg dose of conventional Inderal as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure, and rate pressure product. Inderal LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. **Hypertension:** Inderal LA is indicated in the management of hypertension; it may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. Inderal LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: Inderal LA is indicated for the long-term management of patients with angina pectoris.

Migraine: Inderal LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: Inderal LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. Inderal LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. Inderal is contraindicated in 1) cardiogenic shock; 2) sinus bradycardia and greater than first-degree block; 3) bronchial asthma; 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with Inderal.

WARNINGS. **CARDIAC FAILURE:** Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or Inderal should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of Inderal therapy. Therefore, when discontinuance of Inderal is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If Inderal therapy is interrupted and exacerbation of angina occurs, it usually is advisable to reinstitute Inderal therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema) — PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. Inderal should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY: The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

Inderal (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOGLYCEMIA: Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS: Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T₄ and reverse T₃, and decreasing T₃.

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. GENERAL: Propranolol should be used with caution in patients with impaired hepatic or renal function. Inderal (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should be told that Inderal may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS: Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS: Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if Inderal (propranolol HCl) is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncopal attacks or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium-channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure, or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenytoin, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T₃ concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY: Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY: Pregnancy Category C. Inderal has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. Inderal should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS: Inderal is excreted in human milk. Caution should be exercised when Inderal is administered to a nursing woman.

PEDIATRIC USE: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular: Bradycardia; congestive heart failure; intensification of AV block; hypotension; paresthesia of hands; thrombocytopenic purpura; arterial insufficiency, usually of the Raynaud type.

Central Nervous System: Light-headedness; mental depression manifested by insomnia, lassitude, weakness, fatigue; reversible mental depression progressing to cataplexy; visual disturbances; hallucinations; vivid dreams; an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy, and vivid dreams appear dose related.

Gastrointestinal: Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic: Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory: Bronchospasm.

Hematologic: Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-immune: In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous: Alopecia, LE-like reactions, psoriasisiform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (practolol) have not been associated with propranolol.

DOSAGE AND ADMINISTRATION. Inderal LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from Inderal Tablets to Inderal LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. Inderal LA should not be considered a simple mg-for-mg substitute for Inderal. Inderal LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION — Dosage must be individualized. The usual initial dosage is 80 mg Inderal LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS — Dosage must be individualized. Starting with 80 mg Inderal LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE — Dosage must be individualized. The initial oral dose is 80 mg Inderal LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, Inderal LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS — 80-160 mg Inderal LA once daily.

PEDIATRIC DOSAGE — At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

LETTERS TO THE EDITOR

Brand Medically Necessary; Ways To Avoid Malpractice

Brand Medically Necessary

November 16, 1987

Dear Doctor Krosnick:

The federal government has done it again. In the name of "cost containment" the Health Care Financing Administration (HCFA) has established new, restrictive prescribing and dispensing regulations for drugs prescribed for Medicaid patients. The burden of "accommodating" to these new rules, so that

Medicaid patients can continue to receive the drugs they need, of course, has been placed on health care practitioners, physicians, dentists, and pharmacists.

Specifically, HCFA has placed upper payment limits on a long list of multi-source drugs. They want prescribers to prescribe generic drug products and pharmacists to dispense generic drug products for Medicaid patients. However, they have left one avenue for prescribers to insist that a brand name product, instead of a generic, be dispensed from this long list of maximum allowable cost drugs.

That avenue is as follows: The prescriber must write, in his or her own handwriting on the face of the prescription (no telephone) the specific words "brand medically necessary." If the prescriber uses any other words to prevent substitution, pharmacists will be faced with a dilemma; he cannot dispense a generic and he will not be paid for the more expensive brand products by the government under the Medicaid program.

There are approximately 60 drugs affected by this new regulation, which is too long a list to memorize, and HCFA will be expanding this list as time goes on. To assure that Medicaid patients can obtain their prescribed drugs promptly, and to prevent a multitude of phone calls to prescribers by pharmacists, prescribers should begin writing "brand medically necessary" (pre-printing or rubber stamps are not allowed) on any prescriptions written for Medicaid patients if the

prescriber wants to prevent generic interchange on that prescription.

Respectfully,

Leon R. Langley

NJ Pharmaceutical Association

Ways To Avoid Malpractice

December 31, 1987

Dear Doctor Krosnick:

The cover story of the *NEW JERSEY MEDICINE* in the December 1987 issue is very laudable. However, I would like to add one more way to avoid malpractice suits: Many times a patient sees another doctor for a subtle complaint which may or may not be related to the previous treatment, such as surgery. All of a sudden, for some reason or another, the doctor tells the patient, "Had you seen me the first time, I would have done it differently." In other words, criticizing the work of another doctor without investigating in depth, invites malpractice suits.

(signed) Roy C. Cabrera, M.D.

January 22, 1988

Dear Doctor Krosnick:

I certainly agree with Dr. Cabrera. In reviewing malpractice cases, we continue to be impressed with the large number that are caused by the comment, or even the "raised eyebrow" of a second physician. Our article was dealing particularly with avoiding malpractice suits against oneself, and that is the reason this was not included. I appreciate the opportunity to call attention to this most important factor.

(signed) Paul J. Hirsch, M.D.

***The Age of Miracles;
Cranial Computed
Tomography and MRI;
Breast Imaging;
Snoring and Obstructive
Sleep Apnea***

***The Age of Miracles.
Medicine and Surgery in
the 19th Century***

Guy Williams. Chicago, IL, Academy. (\$16.95)

Although not a physician, Guy Williams grew up in a medical environment, with a father and a brother who were country practitioners. During the past 30 years, his writings on various aspects of social history always have indicated a more than casual interest in the development of our profession. Williams's latest book, *The Age of Agony*, devoted to an overly gruesome account of medical experience during the 18th century, apparently was intended as a prelude to the present work.

Here, the tone is quite rightly ebulliently optimistic. Beginning with the anatomical advances made by John Hunter and his followers, Williams proceeds to give us glowing accounts of such developments as the discovery of anesthesia, antiseptics, x-rays, and radium. Other chapters are devoted to midwives and obstetrics, mental healing and the asylum, and alternative medicine, including homeopathy, water cures, and herbal therapy.

I found the author's use of his material to be basically correct and informative, even though the style of writing is somewhat pedestrian and unstimulating. Written for the consumption of the general reader, the book also should prove useful to the medical historian as a review of the century which undoubtedly produced the most momentous advances in the entire history of medicine.

Morris H. Saffron, M.D.

***Cranial Computed
Tomography and MRI,
2nd Edition***

Seungho Howard Lee, M.D., and Krishna C. V. G. Rau, (eds). McGraw-Hill, 1987. Pp. 880. (\$125)

This new edition of a recognizedly excellent text adds the study of magnetic resonance imaging (MRI) to the basic format of its earlier volume.

After an initial review of the physics of computer tomography (CT) and MRI, the editors provide a review of anatomy utilizing gross sections, CT, and MRI. Their chapter on the orbit is extensive and with good quality CT scans; unfortunately, MRI is lacking here. Brain diseases are divided into chapters that include craniocerebral anomalies, trauma, tumors, and atrophy. The sections on the sella and temporal bone as well as the section on stroke are well written. The quality of the CT scans overall are of fair quality with some variance. MRI, for the most part, is relegated to a special section.

As with the first edition, the book's strong feature is that it is a very well written and extensive text. However, MRI does not receive the expanded treatment I had hoped to find here. Overall, for an excellent cranial CT text, this is the book.

Neil B. Horner, M.D.

***A Multimodality
Approach to
Breast Imaging***

Soar Porrath, M.D., (ed). Rockville, MD, Aspen Publishers, 1986. Pp. 384. (\$63.50)

This book aims to provide the "imager" with a perspective of his or her role in the diagnosis of breast diseases. In pursuit of that goal, Dr. Porrath had divided his work into comprehensively titled sections that

include imaging modalities, plastic surgery and psychology, benign diseases, malignant diseases, male breast diseases, and the post-irradiated breast.

The discussion of the chapters proceeds on similar lines. After a brief review of the topic, several case studies provide examples. The chapters tend to be short, but they are well written. Good quality pictures illustrate the chapters. However, technical aspects are not discussed in detail, and the subjects of diaphanography (transillumination) and thermography—a separate chapter on each concern—are of uncertain value. Although the book addresses itself to essential topics, it may be more useful to the physician who seeks a general and lucid introduction to the diagnostic modalities of breast diseases.

Neil B. Horner, M.D.

***Snoring and Obstructive
Sleep Apnea***

D.N.F. Fairbanks, S. Fujita, T. Ikamatsu, F.B. Simmons. New York, NY, Raven Press, 1987. Pp. 268.

This book was written by four authors and 12 contributors with the stated purpose to serve as a guide to sleep disorders for the otolaryngologist and the head and neck surgeon. This is reflected by the 21 pages devoted to medical therapy of the obstructive sleep apnea syndrome (OSA) as compared to the 90 pages regarding the surgical approach, in particular the procedure of uvulopalatopharyngoplasty—created by one of the authors and introduced into this country by another physician.

This is an indepth discussion of a subject not readily available, with a extensive discussion of snoring as presented in five segments.

The rambling, slightly repetitive and manipulative style aside, the book is a very readable and informative introduction to sleep-disordered breathing events. The chapters relating the cardiopulmonary pathophysiology of snoring and sleep apnea as well as nonsurgical therapeutics are excellent summaries of the recent literature.

This book fulfills its stated purpose for a reasonable price and can be recommended as an introductory text to all physicians.

Monroe S. Karetzky, M.D.

**Drs. Armstrong; Barata;
Bundens; Caruso; Douglass;
Earp; Eckstein; Feuer;
Goldman; Greenbaum;
Greenfield; McCune;
Meinhard, O'Neill, Small;
Vail; Vanderbeck**

Dr. Lorrimer Armstrong

After 47 years as a staff surgeon at Rahway Hospital, Lorrimer Armstrong, M.D., died on October 23, 1987, at the age of 87. He had been retired in Carmel, California, since 1977. Born in Shawnee, Oklahoma, Dr. Armstrong received his medical degree at the University of Pennsylvania School of Medicine, Philadelphia, in 1926. As a staff surgeon at Rahway Hospital, he was a member of the hospital's Board of Governors, president of the medical staff, and chief of surgery. In 1973, Dr. Armstrong was a recipient of the Rahway Hospital's prestigious Humanitarian Award. A member of our Union County component, he served on its Board for 40 years, including a presidential term. His active years of service to the Medical Society of New Jersey earned him the Society's Meritorious Service Award. Dr. Armstrong was a Fellow of the American and International Colleges of Surgeons, and was a member of the Academy of Medicine of New Jersey, of the American Medical Association, as well as an elected member of the Society of Surgeons of New Jersey. He was a recipient of MSNJ's Golden Merit Award in 1976.

Dr. Rogelio J. Barata

A specialist in general and thoracic surgery, Rogelio Jose Barata, M.D., died on September 26, 1987, at the age of 75. A native of Havana, Cuba, Dr. Barata received his medical degree from the Faculty of Medicine, University of Havana, Cuba, in 1940, maintaining a private surgical practice until 1961, when he emigrated to the United States. He became affiliated with St. Mary Hospital, Hoboken. A member of our Hudson County component, and of the American Medical Association, Dr. Barata was a Diplomate in both general surgery and thoracic surgery.

Dr. W. D. Bundens, Jr.

Warner Davenport Bundens, Jr., M.D., of Woodbury, died on September 9, 1987, at the age of 71. A native of Jefferson, Dr. Bundens received his medical degree from Temple University School of Medicine, Philadelphia, in 1941. As an orthopedic specialist, Dr. Bundens served in the United States Navy, from 1942 to 1964, emerging with the rank of captain. After retiring from the Navy, he became affiliated with Shriners Hospital, the United States Naval Hospital, Philadelphia General Hospital, all in Philadelphia, and Underwood Memorial Hospital, Woodbury. Dr. Bundens also was a professor of orthopedic surgery at Temple University School of Medicine. He was a Fellow of the American College of Surgeons, and of the American Academy of Orthopedic Surgeons, and was a member of the New Jersey Orthopedic Society, of our Gloucester County component, and of the American Medical Association.

Dr. Paul F. Caruso

Retired since 1985 in Dover, Delaware, Paul Felix Caruso, M.D., 78, died on November 27, 1987, after having served for 50 years as a general practitioner at Hackensack Medical Center. A native of Brooklyn, New York, Dr. Caruso was graduated from the University of Washington School of Medicine, Seattle, in 1935. During his 50-year tenure at Hackensack Medical Center, he served as a parasitology consultant and an associate attendant in pathology. Dr. Caruso was associate director of the arthritis clinic, co-founder of the tumor clinic, and was one of two

doctors to perform the first replacement transfusions in Bergen County. For these contributions and many years of service to the Medical Center, he received Hackensack Medical Center's Golden Award. He was a member of our Bergen County component and of the American Medical Association. Dr. Caruso served in the United States Navy during World War II, attaining the rank of captain. He received MSNJ's Golden Merit Award in 1985.

Dr. William C. Douglass

Retired in Lynchburg, Virginia, general practitioner William Courtney Douglass, M.D., died on October 1, 1987, at the age of 88. Born in Shanghai, China, Dr. Douglass received his medical degree from Cornell University Medical College, New York, in 1925. He maintained a partnership practice with his wife in Bernardsville for many years. A specialist in chest diseases, Dr. Douglass served as a tuberculosis clinician for Somerset county, and was a Fellow of the American College of Chest Physicians. He was a member of our Somerset County component and of the American Medical Association.

Dr. Ruth Earp

Retired Bernardsville general practitioner Ruth Earp, M.D., died at the age of 84 on November 20, 1987. A native of North Plainfield, Dr. Earp received her medical degree from Cornell University Medical College, New York, in 1928. She maintained a partnership practice with her husband in Bernardsville, and became a member of our Morris County component, of the American Medical Association, and of the American Association of General Practitioners. From 1929 to 1933, Dr. Earp was a medical missionary in Hunan, China. She was a 1978 recipient of the Medical Society of New Jersey's Golden Merit Award for her 50 years in medical practice.

Dr. David Eckstein

A retired specialist in internal medicine and geriatrics, David Eckstein, M.D., of Trenton, died on November 24, 1987, at the age of 75. Born in Trenton and a life-long area resident, Dr. Eckstein received his medical degree from Jefferson Medical College, Philadelphia, in 1938.

After 22 years of private geriatric practice in Trenton, Dr. Eckstein was a senior physician from 1968 to 1970 at Meadow Lakes Retirement Community, where he became medical director in 1970, continuing in that capacity until his retirement in 1981. He was a staff member of St. Francis Medical Center, Trenton, and The Medical Center at Princeton. Dr. Eckstein, as a member of the Medical Society of New Jersey, served as chairman of its Board of Trustees, and as chairman of its Committee on Biomedical Ethics. He served with the New Jersey Department of Community Affairs, receiving the Governor's Award from Governor Thomas H. Kean on November 12, 1987. Dr. Eckstein was past-president and co-founder of the New Jersey Medical Directors Association, and a former member of the American Medical Association's Committee on Aging, acting as an AMA delegate to the White House Conference on Aging in 1971. Former chairman of the Section on Long-Term Care of the American Geriatrics Society, Dr. Eckstein was a visiting lecturer with the Geriatrics Division of Family Practice, for the University of Medicine and Dentistry of New Jersey. Professional advisor of Governmental Health Programs (Medicare) Office, Prudential Insurance Company, he was a consultant with the Disability Review Section of the New Jersey Division of Pensions. Dr. Eckstein was a trustee of the Presbyterian Homes Foundation of New Jersey, and was medical director of the Adult Day Care Center at Mercer Street Friends. He was a member of our Mercer County component, of the American Medical Association, of the New Jersey Society of Clinical Pathologists, of the New Jersey Commission on Legal and Ethical Problems in the Delivery of Health Care, and of the New Jersey Nursing Home Administrators Licensing Board.

Dr. Joseph A. Feuer

After maintaining an internal medicine practice in Kearny for 50 years, Joseph A. Feuer, M.D., died on November 1, 1987, at the age of 78. Born in New York City, Dr. Feuer was graduated from the Long Island College of Medicine, Brooklyn, where he received his medical degree in 1933. He became affiliated with Newark Beth Israel Medical Center, and West

Hudson Hospital, Kearny, where he became president of the medical staff. A member of our Essex County component, of the American Medical Association, and of the Academy of Medicine of Northern New Jersey, Dr. Feuer was a Fellow of the American College of Chest Physicians and of the American College of Gastroenterology. He received MSNJ's Golden Merit Award in 1983 for 50 years of medical practice.

Dr. Solomon Goldman

Dermatologist Solomon Goldman, M.D., died on August 17, 1987, at the age of 86. A native of Austria, Dr. Goldman received his medical degree from Creighton University School of Medicine, Nebraska, in 1931. He became affiliated with Roosevelt Hospital, Metuchen, and St. Peter's Medical Center, and Robert Wood Johnson University Hospital (formerly Middlesex General Hospital), both in New Brunswick. A Diplomate in dermatology and a Fellow of the American Academy of Dermatology, Dr. Goldman was a member of our Middlesex County component, and of the American Medical Association. In 1981, he received MSNJ's Golden Merit Award for 50 years of medical practice.

Dr. Joseph Greenbaum

Joseph Greenbaum, M.D., an allergist, died on November 3, 1987, at the age of 79. A resident of Tenafly, he maintained a private practice in Teaneck for 36 years. Dr. Greenbaum also was a founding member of the Brooklyn Medical Group branch of HIP, where he practiced for 52 years, until the time of his death. A native of Brooklyn, New York, he received his medical degree from Long Island College of Medicine, New York, in 1934. During World War II, he served as a Captain in the United States Army medical corps. He was a member of our Bergen County component, and a Fellow of the American Academy of Allergy, of the American College of Allergy, and of the New Jersey Allergy Society. For his 50 years of medical practice, Dr. Greenbaum received MSNJ's Golden Merit Award in 1984.

Dr. William J. Greenfield

Retired in North Palm Beach, Florida, after years of practice in

rhinology and plastic surgery, William John Greenfield, M.D., died on September 29, 1987, at the age of 98. Born in Clara City, Minnesota, Dr. Greenfield received his medical degree in 1918 from the University of Michigan Medical School, Ann Arbor. He became affiliated with Hackensack Medical Center. A Diplomate in otolaryngology, Dr. Greenfield was a Fellow of the American College of Surgeons, and of the American Academy of Ophthalmology and Otolaryngology, and was a member of our Bergen County component, and of the American Medical Association. He was a 1968 recipient of MSNJ's Golden Merit Award.

Dr. Carrol R. McCune

Carrol Richard McCune, M.D., 64, died on December 7, 1987, after 35 years as a family practitioner in Pompton Plains. Born in East Rutherford, Dr. McCune received his medical degree from Georgetown University School of Medicine, Washington, D.C., in 1951. A resident of Pompton Plains for 35 years, Dr. McCune was a physician for the Pompton Plains schools. He became affiliated with Chilton Memorial Hospital, Pompton Plains, and was a member of our Passaic County component, and of the American Medical Association. During World War II, he served as a United States Navy navigator.

Dr. Fred Meinhard

Family practitioner Fred Meinhard, M.D., died on September 20, 1987, at the age of 72. A native of Newark, Dr. Meinhard received his medical degree from Creighton University School of Medicine, Nebraska, in 1937. A specialist in allergy, Dr. Meinhard was affiliated with Clara Maass Medical Center, Belleville, and St. James Hospital, Newark. He was a Diplomate in family practice, a Fellow of both the American Academy of Allergy and of the American College of Allergy, and was a member of our Essex County component, of the New Jersey Academy of Allergy, and of the American Medical Association. During World War II, Dr. Meinhard served in the United States Army, emerging with the rank of lieutenant colonel. He was a Golden Merit Award recipient in 1987.

Dr. Joseph F. O'Neill

Retired since 1979 in Whiting, family practitioner Joseph Francis O'Neill, M.D., died on November 19, 1987, at the age of 77. Born in Trenton, Dr. O'Neill was graduated from Hahnemann Medical College, Philadelphia, in 1935. He resided in Hopewell, maintaining a family practice until his retirement in 1978. Dr. O'Neill was a member of our Mercer County component and of the American Medical Association. For his 50 years as a physician, Dr. O'Neill received MSNJ's Golden Merit Award in 1985.

Dr. Louis Small

Retired one year after over 45 years of family practice in Passaic, Louis Small, M.D., died on November 25, 1987, at the age of 84. Born in Passaic, and a life-long area resident, Dr. Small received his medical degree from Jefferson Medical Col-

lege of Philadelphia, in 1936. In addition to his private practice, he became affiliated with the General Hospital Center at Passaic, as well as Beth Israel Hospital, Passaic. He was a United States Army medical corps veteran of World War II, having attained the rank of captain. Dr. Small was a member of our Passaic County component and of the American Medical Association. In 1986, he received MSNJ's Golden Merit Award.

Dr. William D. Vail

Retired specialist in occupational medicine, William Davis Vail, M.D., died on February 15, 1987, at the age of 68. A native of New York City, Dr. Vail was graduated from Columbia University College of Physicians and Surgeons, in 1944. He became affiliated with Overlook Hospital, and St. Barnabas Medical Center. Dr. Vail was a member of our Essex County component and of the AMA.

Dr. James J. Vanderbeck

Retired obstetrician-gynecologist James Joseph Vanderbeck, M.D., died on November 29, 1987, at the age of 82, in Chicago. Born in Paterson, Dr. Vanderbeck received his medical degree from Georgetown University School of Medicine, Washington, D.C., in 1933. He maintained a private practice for 32 years in Ridgewood, and became affiliated with St. Joseph's Hospital and Medical Center, Paterson, and Valley Hospital, Ridgewood. He was a member of our Bergen County component, of the American Medical Association, and of the New Jersey Obstetrical and Gynecological Society. During World War II, Dr. Vanderbeck served with the United States Army medical corps, emerging with the rank of captain. In 1983, he received the Medical Society of New Jersey's Golden Merit Award for his 50 years as a physician in his community.

AUTHOR INFORMATION

New Jersey Medicine is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in New Jersey Medicine is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

**EAGLE ROCK AVENUE, ROSELAND

ORTHOPAEDIC SURGEON

A highly successful multi-specialty group with three orthopaedic surgeons is searching for a fourth orthopaedist. All types of general orthopaedic problems are treated; however, due to the significant volume of back injury cases we encounter, an interest in spinal injuries is important. The income potential for an ambitious orthopaedic surgeon is excellent. The practice is located in a growing Mid-Atlantic state only twenty miles from a beach resort area. Baltimore and Philadelphia are also within close proximity. If you are interested, please submit your curriculum vitae and references to Mr. J. Stokes, P.O. Box 19, Milford, DE 19963.

RADIOLOGIST

Needed for private office practice located in North Central New Jersey. Part-time 1-2 afternoons/week.

YOUR ROCHE REPRESENTATIVE WOULD LIKE YOU TO HAVE SOMETHING THAT WILL ...

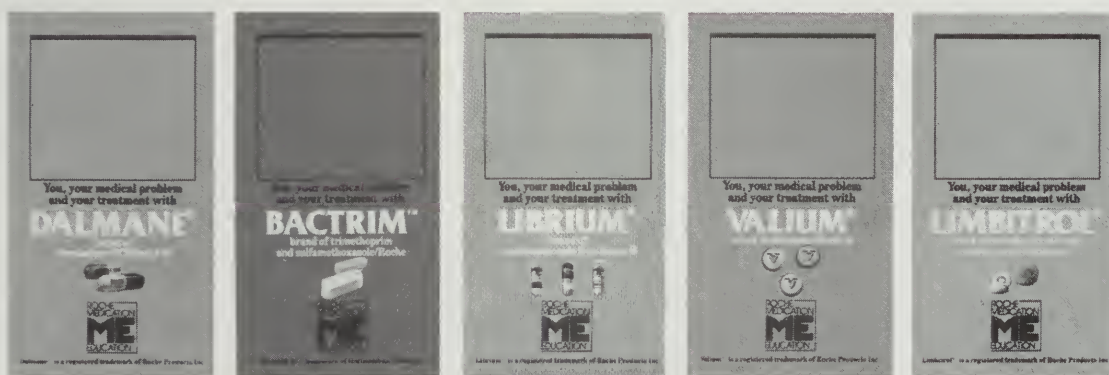

- ... improve patient satisfaction with office visits
- ... improve patient compliance with your instructions
- ... reduce follow-up calls to clarify instructions

The new Roche product books

- Offer a supplement to, not a substitute for, patient contact
- Support your specific instructions to the patient
- Provide a long-term reinforcement of your oral counseling

Because you are the primary source of medical information for your patients, we invite you to look over the Roche Product Booklets shown below and ask your Roche representative for a complimentary supply of those applicable to your practice.

Medicines that matter from people who care

COMMITTED TO EXCELLENCE

The logo is a large, stylized yellow flower-like shape with multiple petals. At the top center is a black circle containing a white hexagon with the word "ROCHE" in black capital letters. Below this, the words "PRESIDENT'S ACHIEVEMENT AWARD" are written in black capital letters.

The appearance of advertising in NEW JERSEY MEDICINE is not a Medical Society of New Jersey guarantee or endorsement of the product or service, or the claims made for the product or service, by the advertiser. When the Medical Society of New Jersey has endorsed a product or program, that will be expressly noted.

Before prescribing, see complete prescribing information in SK&F LAB CO. literature or PDR. The following is a brief summary.

Contraindications: There are no known contraindications to the use of 'Tagamet'.

Precautions: While a weak antiandrogenic effect has been demonstrated in animals, 'Tagamet' has been shown to have no effect on spermatogenesis, sperm count, motility, morphology or in vitro fertilizing capacity in humans.

In a 24-month toxicity study in rats at dose levels approximately 9 to 56 times the recommended human dose, benign Leydig cell tumors were seen. These were common in both the treated and control groups, and the incidence became significantly higher only in the aged rats receiving 'Tagamet'.

Rare instances of cardiac arrhythmias and hypotension have been reported following the rapid administration of 'Tagamet' HCl (brand of cimetidine hydrochloride) injection by intravenous bolus.

Symptomatic response to 'Tagamet' therapy does not preclude the presence of a gastric malignancy. There have been rare reports of transient healing of gastric ulcers despite subsequently documented malignancy.

Reversible confusional states have been reported on occasion, predominantly in severely ill patients.

'Tagamet' has been reported to reduce the hepatic metabolism of warfarin-type anticoagulants, phenytoin, propranolol, chlorthalidone, diazepam, lidocaine, theophylline and metronidazole. Clinically significant effects have been reported with the warfarin anticoagulants; therefore, close monitoring of prothrombin time is recommended, and adjustment of the anticoagulant dose may be necessary when 'Tagamet' is administered concomitantly. Interaction with phenytoin, lidocaine and theophylline has also been reported to produce adverse clinical effects.

However, a crossover study in healthy subjects receiving either 'Tagamet' 300 mg. q.i.d. or 800 mg. h.s. concomitantly with a 300 mg. b.i.d. dosage of theophylline (Theo-Dur®, Key Pharmaceuticals, Inc.),

demonstrated less alteration in steady-state theophylline peak serum levels with the 800 mg. h.s. regimen, particularly in subjects aged 54 years and older. Data beyond ten days are not available. [Note: All patients receiving theophylline should be monitored appropriately, regardless of concomitant drug therapy.]

Lack of experience to date precludes recommending 'Tagamet' for use in pregnant patients, women of childbearing potential, nursing mothers or children under 16 unless anticipated benefits outweigh potential risks; generally, nursing should not be undertaken in patients taking the drug since cimetidine is secreted in human milk.

Adverse Reactions: Diarrhea, dizziness, somnolence, headache, rash. Reversible arthralgia, myalgia and exacerbation of joint symptoms in patients with preexisting arthritis have been reported. Reversible confusional states [e.g., mental confusion, agitation, psychosis, depression, anxiety, hallucinations, disorientation], predominantly in severely ill patients, have been reported. Gynecomastia and reversible impotence in patients with pathological hypersecretory disorders receiving 'Tagamet', particularly in high doses, for at least 12 months, have been reported. Reversible alopecia has been reported very rarely. Decreased white blood cell counts in 'Tagamet'-treated patients [approximately 1 per 100,000 patients], including agranulocytosis [approximately 3 per million patients], have been reported, including a few reports of recurrence on rechallenge. Most of these reports were in patients who had serious concomitant illnesses and received drugs and/or treatment known to produce neutropenia. Thrombocytopenia [approximately 3 per million patients] and a few cases of aplastic anemia have also been reported. Increased serum transaminase and creatinine, as well as rare cases of fever, interstitial nephritis, urinary retention, pancreatitis and allergic reactions, including hypersensitivity vasculitis, have been reported. Reversible adverse hepatic effects, cholestatic or mixed cholestatic-hepatocellular in nature, have been reported rarely. Because of the predominance of cholestatic features, severe parenchymal injury is considered highly unlikely.

A single case of biopsy-proven periportal hepatic fibrosis in a patient receiving 'Tagamet' has been reported.

How Supplied: Tablets: 200 mg. tablets in bottles of 100; 300 mg. tablets in bottles of 100 and Single Unit Packages of 100 [intended for institutional use only]; 400 mg. tablets in bottles of 60 and Single Unit Packages of 100 [intended for institutional use only], and 800 mg. Tiltab® tablets in bottles of 30 and Single Unit Packages of 100 [intended for institutional use only].

Liquid: 300 mg./5 ml., In 8 fl. oz. (237 ml.) amber glass bottles and in single-dose units (300 mg./5 ml.). In packages of 10 [intended for institutional use only].

Injection: Vials: 300 mg./2 ml. in single-dose vials, in packages of 10 and 30, and in 8 ml. multiple-dose vials, in packages of 10 and 25.

Prefilled Syringes: 300 mg./2 ml. in single-dose prefilled disposable syringes.

Plastic Containers: 300 mg. in 50 ml. of 0.9% Sodium Chloride in single-dose plastic containers, in packages of 4 units. No preservative has been added.

ADD-Vantage® Vials: 300 mg./2 ml. in single-dose, ADD-Vantage® Vials, in packages of 25.

Exposure of the premixed product to excessive heat should be avoided. It is recommended the product be stored at controlled room temperature. Brief exposure up to 40°C does not adversely affect the premixed product.

'Tagamet' HCl [brand of cimetidine hydrochloride] Injection premixed in single-dose plastic containers is manufactured for SK&F Lab Co. by Travenol Laboratories, Inc., Deerfield, IL 60015.

* ADD-Vantage® is a trademark of Abbott Laboratories.

MEDICARE

Changes Affecting Patients and Physicians

Containing 118 provisions impacting on Medicare, Medicaid, and other health-related government programs, the Omnibus Budget Reconciliation Act of 1987 (P.L. 100-203) was signed by President Reagan on December 22, 1987. Most provisions of the new law became effective April 1, 1988.

Maximum Allowable Actual Charges (MAACs), prevailing and customary charges, and laboratory fee schedules remain frozen at 1987 levels during the first three months of 1988. In addition, physicians will have a second sign-up period for the Medicare participation program. Participation agreements signed at this time became effective April 1, 1988.

New physicians, defined as those who start providing care to Medicare beneficiaries for the first time after April 1, 1988, will be reimbursed at 80 percent of the Medicare Economic Index (MEI) adjusted prevailing charge. New physicians providing primary care services and services furnished in designated rural areas will be reimbursed at the 50th percentile level, unadjusted prevailing charge (this will be higher).

Increases in the MEI. The Medicare Economic Index (MEI) increased as of April 1, 1988. Another update is scheduled January 1, 1989. Physician's customary and prevailing charges will be based on actual charges from July 1, 1986, to June 30, 1987. Participating physicians will receive a 3.6 percent update on primary care services and a 1 percent update on all other services as of April 1. Primary care services are defined as: office medical services; emergency department services; home medical services; skilled nursing, intermediate care, and long-term care medical services; or nursing home, boarding home, domiciliary, or custodial care medical services.

Nonparticipating physicians will receive 4.5 percent less than participating physicians.

There will be no increase on new physician services such as supplies and clinical lab.

Overpriced Procedures. Beginning April 1, 1988, Medicare reimbursement for a number of surgical procedures the Health Care Financing Administration (HCFA) labeled "overpriced" have been reduced from 2 to 15 percent. The amount of the reduction depends upon how much the area prevailing charge exceeds 85 percent of the national average prevailing charge.

The procedures involved include coronary artery bypass, total hip replacement, cataract surgery, transurethral prostatectomy, suprapubic prostatectomy, diagnostic and/or therapeutic dilatation and curettage, carpal tunnel neurolysis and/or transposition, pacemaker surgery, bronchoscopy, upper gastrointestinal endoscopy, knee arthroscopy, and knee arthroplasty.

Specialty Issues. From April 1, 1988, through December 31, 1990, physicians who concurrently direct two or more nurse anesthetists will have their reimbursement reduced. The reduction is 10 percent for two nurse anesthetists, 25 percent for three nurse anesthetists, and 40 percent for four nurse anesthetists. There also is a 10 percent reduction beginning January 1, 1989, for each concurrent iridectomy or cataract surgery nurse anesthetist supervision.

A radiologic fee schedule with limits on actual charges will be developed for 1989. This is restricted to board certified or board eligible radiologists. In-office laboratory services billed to Medicare must be taken on assignment. Penalties now apply to physicians who bill patients for these services.

Physicians who purchase diagnostic and other x-ray services cannot charge more than the actual costs as of April 1, 1988. As of January 1, 1988, all clinical laboratory services must be accepted on assignment. A physician may not bill the patient on a nonassigned basis or penalties can be applied for a single, deliberate violation.

Ambulatory Surgery Center Services. Medicare payment for physicians' services furnished after March 31, 1988, in an ambulatory surgical center (ASC) or a hospital outpatient department on an assigned basis will be subject to deductible and coinsurance requirements. All services will be paid at 80 percent of the prevailing charge even when assignment is accepted.

Physicians must collect the remaining 20 percent from the patient or supplemental insurance. An intraocular lens implanted in an ASC must be billed by the facility.

Peer Review Organizations. The budget bill contains a number of provisions related to the PRO program. PROs now are required to provide reasonable notice and opportunity for discussion prior to denial.

of a claim. Of particular interest to small and rural hospitals is a new requirement for "significant on-site review activities, including on-site review in at least 20 percent of the rural hospitals in the PRO's area."

Another significant provision of the law calls for "pre-exclusion hearings." Before the secretary of the U.S. Department of Health and Human Services (HHS) may exclude a physician or provider located in a rural area from the Medicare program, a hearing before an administrative law judge is required. In addition, the secretary is required to file a report to Congress on these "improvements" to the PRO program.

Considerations About Participation. There are a number of factors to consider when making your participation decision: the proportion of patients in the practice who are Medicare beneficiaries; current percentage of patients and dollars taken on assignment; 1987 experiences with MAACs or participating physician status; participating physicians are required to accept assignment in all cases—nonparticipating physicians have the option of accepting Medicare assignment on a case-by-case basis; Medicare's preferential treatment of participating physicians (for example, a financial disclosure letter is required of nonparticipating physicians performing nonemergency surgery where total charges exceed \$500); the difference between the 1988 prevailing charge and the 1988 MAACs; and the physician's individual philosophical stance on participation.

DEPARTMENT OF HUMAN SERVICES

Hearing Aid Assistance

A new program, "Hearing Aid Assistance to the Aged and Disabled (HAAAD)," became effective February 4, 1988. This program pays over \$100 towards the cost of a hearing aid to individuals who are over age 65 or receiving Social Security disability benefits and meet income and residency guidelines. Annual income must not exceed \$13,650 for a single individual or \$16,750 for a married couple. The person must have established a permanent legal residence in New Jersey for 30 days before applying. Applications may be obtained by calling 1-800-792-9745.

AMERICAN MEDICAL ASSOCIATION

Health Care Costs Rise

The cost of providing health care benefits to employees jumped to an average of \$1,985 per worker last year as employers hunted for new ways to control costs. A poll of 2,016 corporate and government employers found that their costs rose 7.9 percent last year, or an average \$128 per employee, said A. Foster Higgins & Co. which conducted the survey. The average cost had risen 7.7 percent in 1986.

MEDICAL SOCIETY OF NEW JERSEY

Carrier-Directed Medical Audits

A number of casualty carriers and certain health insurers have been using audit firms in their claims payment and settlement practices. These audit firms usually will request copies of patient records and also will attempt to negotiate with physicians for reduced fees.

Audit firms are entitled to review a patient's record when they present a signed patient release. When you

are advised that they are reducing your fees or questioning utilization, ask for a statement in writing. Also, please remember that medical necessity determinations are a physician function. Therefore, you should request the name of the physician being used by the audit firm.

Finally, it should be noted that some firms attempt to leverage a settlement by offering to pay 75 or 80 percent of the bill amount rather than "conducting an audit of the records." This "save your grief" technique is not approved by the Insurance Department and encourages manipulation. Please remember that claim adjusters and audit companies justify their existence by reductions in payment.

If you have any questions regarding the problems discussed, or other reimbursement issues, please call Joseph C. Lucci, Director, Medical and Insurance Affairs, MSNJ, 609/896-1766.

SOCIAL SECURITY ADMINISTRATION

AIDS Patients

Low-income people with AIDS are eligible to receive Supplemental Security Income and Medicaid benefits as soon as they are diagnosed with the disease, under regulations made final by the Social Security Administration. Publication of the new rule is not expected to change actual practices since interim regulations in effect since 1985 follow the same basic guidelines.

AMA ADVISORS

Investing Abroad

A decade ago, a diversified portfolio for an individual investor simply meant owning domestic stocks and bonds, with perhaps some gold or real estate thrown in. But today, more and more investors are realizing that there are as many investment opportunities beyond U.S. shores as within them. Foreign stocks, bonds, and money market assets are being discovered by individuals.

There are several reasons why venturing overseas with your investment dollars makes sense. First, investing abroad offers a wider scope of investment possibilities. Patriotism aside, the world's largest and fastest growing companies no longer are housed only in the United States.

Taking a global view also increases the diversification of your portfolio, thereby lowering your overall investment risk. The world's economies don't move in lockstep. So even if political uprisings are hurting investments in southeast Asia, it is unlikely they will affect investments in Europe. And if the U.S. stock market temporarily hits a sour note, you may find better pickings in Japan.

Investing abroad also introduces the two-edged sword of currency fluctuations. Suppose you buy British bonds at a time when \$1.75 buys one British pound. You invest \$17,500 to get bonds worth 10,000 pounds. Then the dollar weakens, and a pound equals \$1.90. If you sold your bonds for dollars, you would get \$19,000. That's a \$1,500 profit just on the currency exchange. Of course, if the dollar had strengthened to \$1.60 per pound, you would have lost \$1,500 on the transaction.

How to Buy Foreign Investments. The most direct way to buy foreign stocks or bonds is on the foreign

exchange where the asset is traded. Of course, for individual investors that is easier said than done. The larger brokerage houses often have offices abroad that could execute the trade for you, but your individual broker may be unfamiliar with the procedure. And don't forget to figure in the cost of such a trade.

Some foreign stocks are traded here in the U.S. For instance, shares of two Dutch companies, Royal Dutch Petroleum and KLM Royal Dutch Airlines, both trade on the New York Stock Exchange. Other foreign stocks trade in the U.S. as American Depositary Receipts, commonly called ADRs. An ADR is not an actual stock certificate. Banks holding the stock in vaults overseas issue the ADRs as claims on those shares. ADRs of Sweden's Volvo AB and Britain's Cadbury Schweppes are both available in the U.S. over-the-counter. Japan's Honda Motor ADRs trade on the New York Stock Exchange.

Of course, if you buy your foreign stocks and bonds directly or through ADRs, you will have to be your own investment adviser, which is no mean feat. Investing outside of the U.S. is as fraught with perils as it is with opportunities. There's the task of researching companies located on the other side of the globe. Unless you go to a specialty brokerage firm, your broker may have little or no advice to give you.

You'll also have to keep tabs on the economic situation in numerous countries. You will need to know if any government's policies are about to change. Then there is the political scene. South Africa is a great place to look for gold stocks, but is civil unrest going to undermine your investment? Even if you sidestep all countries going through political or economic upheavals, you can't avoid playing the currency game.

That is why we think the best advice for investors looking overseas is to find a good mutual fund. With mutual funds, professional managers keep track of each market's gyrations and do the stock and bond selecting for you. You get diversification with minimum investments of only a few thousand dollars or less. And you will probably save on commissions and trading costs, particularly if you buy a "no-load" fund, that is, one with no sales commission.

You can select either an international fund or a global fund. International funds buy both domestic and foreign securities, so the manager has more flexibility to pick and choose investments. You also will be able to choose from among funds specializing in foreign stocks, foreign bonds, foreign money market investment, even funds specializing in securities for just one country, like Japan or Korea.

For your first venture abroad, it's probably best to select a fund that invests worldwide and one that gives the fund manager the most latitude. After all, you hired that manager to make foreign securities decisions for you. You should let the manager do just that.

MSNJ ANNUAL MEETING

The Inaugural Reception and Dinner Dance

The Middlesex County Medical Society and the Medical Society of New Jersey cordially invite you to join us in the celebration of the inauguration of Palma E. Formica, M.D., as the first woman President of the Medical Society of New Jersey at a gala Inaugural Reception and Dinner Dance on Saturday, April 30, 1988, in the Diamond Court Ballroom of the Sheraton Meadowlands Hotel, East Rutherford, New Jersey.

The Reception will be held at 6:00 P.M. in the Derby Ballroom. Tickets for this event will be \$5 per person and can be purchased in advance through the Middlesex County Medical Society or at MSNJ's Registration Area at the hotel.

The Inaugural Dinner Dance will be held at 7:30 P.M. in the Diamond Court Ballroom. Tickets for this will be \$50 per person and also may be purchased in advance from the Middlesex County Medical Society or at MSNJ's Registration Area at the hotel.

Please join Dr. Formica, the Middlesex County Medical Society, and the Medical Society of New Jersey for what promises to be a most enjoyable and fun-filled evening.

FINI

"All that has been and all that will be is now! Yesterday is a cancelled check, today is a promissory note, tomorrow is an application for a loan."

INTENSIVE CARE.

Your practice deserves nothing less. And the Medical/Dental Banking Group at Midlantic National Bank/North is uniquely prepared to deliver the kind you need.

Whether you're a third-year resident or long-established in practice, a personalized loan package may be the best prescription for your future. We know the funding needs of new practices, buy-ins, buy-outs and practice expansion may exceed the lending limits of most financing sources. This is why we finance creatively, based on an understanding of medical economics and a repayment plan based on anticipated practice growth rather than fixed schedules.

We speak your language in other areas as well, with practice and personal services such as checking, savings, trust and estate planning, IRAs, custodial accounts, and more.

If you're starting out, start with our free brochure, "The Beginning Physician's Guide to Financing a Practice." Beginner or not, we urge you to call Patrick Robinson, Vice President and Group Manager, toll-free at 1-800-633-0040.

We'd like to make a "house call," and show you how our intensive care can help your practice.

GOVERNMENTAL AFFAIRS UPDATE: CLARK MARTIN, MSNJ LEGISLATIVE CONSULTANT

DETERING PHYSICIAN ASSISTANTS' ADVANCES

Agreeing with the Society and the State Nurses Association, the Assembly has passed a bill which affirms that only the Legislature has the power to create a health care license.

Although simple in substance, A-1591 is symbolically significant. Sponsored by Assemblyman John Bennett (R-Freehold), the bill was introduced to block the Health Department's attempt to promote the licensure of physician assistants by regulation. The bill makes it clear that no state agency may license or otherwise allow a category of health care profession to practice unless first authorized by the Legislature.

After passing in the lower house, A-1591 has advanced to the Senate Committee on Institutions, Health and Welfare. A similar measure, S-1491, also has been referred to that Committee.

Passage of A-1591, by 41 "yes" votes with 15 "no" and 24 abstentions, came after an extended debate. Working against the bill were the physician assistants, the Health Department, and UMDNJ. The controversy over the bill is reflected in its receiving only the minimum number of votes required for passage in the lower house.

Voting for the bill were: Bennett, Cimino, Colburn, Collins, Crecco, Deverin, Doyle, Farragher, Felice, Franks, Frelinghuysen, Genova, Girgenti, Hardwick, Haytaian, Hendrickson, Hudak, Impreveduto, Kamin, Kelly, Kern, Kline, Kyrillos, Littell, LoBiondo, Loveys, Martin, Moran, Naples, Palaia, Randall, Rocco, Roma, Rooney, Schuber, Shinn, Shusted, Singer, Smith (J.), Stuhltrager, and Villane.

Voting against the bill were: Adubato, Albohn, Bush, Duch, Gill, Kenny, Mattison, Menendez, Miller, Ogden, Pascrell, Roberts, Salmon, Schwartz, and Zecker.

Abstaining were: Baer, Brown, Bryant, Charles, Cooper, Doria, Foy, Kalik, Karcher, Kavanaugh, Kronick, Marsella, Mazur, McEnroe, Otlowski, Patero, Pelly, Penn, Riley, Schluter, Smith (R.), Spadoro, Watson, and Zangari.

SOCIETY TACKLES SURCHARGE PLAN

In what may become a protracted battle, the Medical Society of New Jersey has taken its first step to fight

Insurance Commissioner Ken Merin's plan to levy a 4 percent surcharge for the next seven years on every physician's professional liability insurance premium.

The surcharge plan, published as a "preproposal" in the *New Jersey Register* in early February, would be used to pay the debts of the state's now defunct Medical Malpractice Reinsurance Association. Its estimated \$60 million deficit was caused by the state's selling its malpractice insurance to physicians at unreasonably low premiums.

Surcharge proposals seem to be proliferating in the Insurance Department. In quick succession, Commissioner Merin has proposed the malpractice bail out as well as surcharges on auto insurance to prop up the assigned risk pool and on health insurance to subsidize Blue Cross.

The malpractice surcharge has yet to be proposed as a formal rule. But the Society has written Commissioner Merin to express its opposition and point out some of the obvious inequities of his plan. For example:

- The Medical Malpractice Reinsurance Association had insured hospitals during its five years of operation. Yet, hospitals would not be included in the surcharge.
- The proposal would require thousands of physicians who did not buy the state's "bargain" insurance to pay the surcharge, but it is silent about whether physicians employed by governmental agencies are to be included. Yet, some of these physicians purchased their coverage from the state.
- The surcharge plan is based on "guess-timates." No one knows how large the debt will grow; that depends on the outcome of pending lawsuits. And no one knows how much revenue would be raised by the surcharge; that depends on whether malpractice premiums stabilize or continue to rise while the surcharge is in effect.

In any event, the Society is prepared to fight the surcharge on all fronts: regulatory, legal, and legislative.

**“A big insurance company
that’s really listening to me?”**

**I don’t
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we've developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey's medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate in the Blue Cross and Blue Shield network.

If you're not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Just call 1-800-842-BLUE for more information. Of course, there's no obligation.

The best insurance for a healthy practice.

OVER 3000 PATIENTS AND THEIR PHYSICIANS HAVE USED OUR LITHOTRIPTER SERVICE

In a field where experience is often measured in days or months, the Mid-Atlantic Kidney Stone Center stands apart. With nearly three years of expertise as a lithotripsy service, we have treated more than 3000 kidney stone patients resulting in a high degree of confidence by referring physicians in New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware.

Our concern for the patient's well-being is central to our con-

cept of good patient care. Our professional staff prepares the patients for every aspect of treatment with warmth and understanding. We spend a great deal of time with patients to reassure them and explain the procedure. And patients appreciate the personalized care of the Mid-Atlantic Kidney Stone Center.

Our relationship with referring physicians ensures quality care by providing timely communica-

tions during your patient's treatment. In addition, we are available 24 hours a day for pre- and post-treatment consultation. We believe this cooperation between the referring urologist and the staff at Mid-Atlantic is essential to effective treatment and recovery. To find out more about our service, or to obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337. Outside of New Jersey, call (800) 53-LITHO.

The Physical Therapy Bill—Again

PAUL J. HIRSCH, M.D.*

The physical therapy bill is wrong for patients and for New Jersey. The author urges readers to write or call their Congressmen.

The notorious physical therapy bill, which New Jersey physicians fought to a standstill last year, has been reintroduced in both houses of the 1988-89 Legislature. The bill (A-2647/S-2129 last year, now reincarnated as A-587/S-2091) would prohibit physicians from employing physical therapists or having a financial interest in any facility which provides physical therapy services.

Nowhere has such legislation—which would prevent one class of citizens from employing another—been enacted into law.

We believe strongly that this bill would downgrade the quality of medical care in New Jersey and would interfere with the rights of our patients. This special-interest legislation benefits no one, except for the small group of physical therapists who own their own businesses. Ironically, while the bill would place unprecedented restrictions on the physician's practice, it would create financial incentives for physical therapists to employ physicians. The bill is anticonsumer in every respect. Last year, this legislation was opposed by the New Jersey Division of Consumer Affairs, as well as by the Federal Trade Commission (FTC).

Although the bill was introduced in both houses in the last session, most of us know of it by its Assembly number. This is because the battle was fought in the lower house. The Senate bill wasn't even discussed in Committee.

On May 21, 1987, the FTC issued an opinion on A-2647 stating this legislation would "restrict competition" and "is likely to injure consumers by reducing competition among physical therapy providers." The FTC further noted that "A-2647 also could limit a physician's ability to oversee the care provided to patients."

In a previous opinion, in October 1986, the FTC opposed proposed regulation in Nevada, which would have prohibited a physical therapist from being employed by a physician. The FTC stated: "Because of their adverse effects on consumer welfare, the Commission has taken legal action against restrictions on employment relationships in health care practice."

It is clear that A-587/S-2091 would interfere with the quality of medical care in New Jersey. And the bill obviously is bad news to hundreds of physical therapists who are employed by physicians, many of whom would lose their jobs under this legislation.

Last year, physicians in New Jersey made an intensive effort to oppose and defeat this legislation. We must do so again!

In summary:

- A-587/S-2091 is special interest legislation designed to protect the economic interests of those physical therapists who own their own practices.
- There is no evidence that this bill would benefit the public, or public health.
- A-587/S-2091 is anticonsumer in every respect. By eliminating competition, it negates the opportunity to reduce costs.
- A-587/S-2091 reduces opportunities for a physician and physical therapist to work closely together for the benefit of their patients.
- This proposed legislation would narrow the freedom of choice available to the consumer.
- This legislation would be regressive, failing to recognize the current trends in our health care delivery system which are leading to full services at one location.
- If passed, this bill could set a precedent in other areas.

This legislation is wrong for our patients and wrong for New Jersey, and must be defeated. I urge you to write or call your Assemblymen and Senators.

*Dr. Hirsch is First Vice-President of the Medical Society of New Jersey.

How Does Your Current Credit Card Compare To The MSNJ Gold MasterCard® Card?

SPECIAL SAVINGS

Your MSNJ Gold MasterCard® account is issued FREE of an annual fee for the first year, and the continuing annual fee is only \$30.† The account bears a low annual percentage rate of 15.9% on average daily balances up to \$3,500 and, as an added advantage, the rate drops to 14.9% for that portion of your average daily balance over \$3,500. You will find this rate significantly lower than most other credit cards and department store charge cards.

HIGHER LINE OF CREDIT

The personal approach that MBNA® will use in reviewing your application as a Medical Society of New Jersey member may secure for you a higher line of credit ... up to \$15,000!

TRAVEL BENEFITS

Every time you make travel arrangements using your MSNJ Gold MasterCard account you receive these benefits - FREE of any added charge!

- Accepted at over 5 million locations worldwide
- Up to \$3,000 Lost Luggage Coverage
- Credit Card Registration Service
- Up to \$1,000,000 Travel Accidental Death and Dismemberment Insurance
- Up to \$5,000 Emergency Cash and/or Airline Tickets
- Up to \$15,000 Auto Rental Collision Deductible Reimbursement
- Gold PassageSM Travel Service

ASSOCIATION IDENTIFICATION

Couple all of the benefits described here, and much more, with the prestige of carrying a MasterCard that displays our association's identification on the front of the card. You'll agree that this is the *only* credit card to carry.

It's EASY

Apply RIGHT NOW by calling toll free:

1-800-847-7378

Be sure to use the special code BDCZ when calling!

Or complete the brief application below and send it to: MBNA®, P.O. Box 15023, Wilmington, DE 19850

YES I wish to apply for an MSNJ Gold MasterCard account with credit lines up to \$15,000, and all other benefits described above. Should my application for a Gold MasterCard account not be approved, this request constitutes my application for a Silver MasterCard account, also ISSUED FREE of an Annual Fee for the first year.† (Please Print)

Controlling Your Practice

Blueprint for Medical Office Claims Prevention Survey; Physician's Assistant Convicted of Criminal Charges; Virginia Ceiling Unconstitutional

A BLUEPRINT FOR A MEDICAL OFFICE CLAIMS PREVENTION SURVEY

Many malpractice claims which involve both treatment and nontreatment factors are traced to inadequate policies and procedures, communication gaps between caregivers and patients, and flawed communication among health professionals. The incident or issue which triggers a lawsuit may occur even before the physician sees the patient or before medical treatment is rendered. Consider these often-overlooked liability factors:

Scheduling. Are too many patients seen in too little time? Sufficient time must be set aside for each appointment, depending on the reasons for the visit. A flat policy of scheduling patients every x minutes, regardless of the purpose of the visit, invites inevitable delays. A complete physical obviously takes more time than a suture check. Patient opinion polls indicate that what patients dislike most about going to the physician is the long wait. Encourage your staff to ask patients the reason for their visit and establish a system for setting aside time slots according to the patients' problems. Receptionists should ask patients, "Please tell me what you would like to see the physician about so that I can be sure to schedule enough time."

If your patients habitually wait, do a patient flow survey to determine why. Many physicians set aside one to three appointment blocks each day to accommodate emergencies and unexpectedly extended visits. Staff can defuse patients' anger by informing them about delays when they arrive. Giving the patient an opportunity to reschedule or run an errand in the interim shows respect for the patient's time. Most im-

portantly, both staff and physician should apologize to patients if they are kept waiting. And consider changing the name from "waiting room" to "reception room."

Telephone Etiquette. Does your staff create a positive image of your practice on the telephone? The initial impression new patients form of your practice can be influenced by the manner in which staff handles telephone communications. Staff should follow these guidelines:

1. Answer calls promptly; identify the office practice name and give your name. ("Dr. Brown's office. This is Susan. May I help you?")

2. Before placing a caller on hold, say, "Just a moment, please," instead of going off the line without a word, leaving the caller to wonder if he or she was disconnected.

3. At the physician's direction, staff may ask, "May I tell the physician what the call is about?" instead of asking, "Is this personal?" "Are you a patient?" "Have you been here before?" When the person answering learns the nature of the call, the information should be passed on to the physician, so that he or she does not sound uninformed when the call is taken.

4. When callers wait on hold, the receptionist should come back on the line to let them know they have not been forgotten and apologize for any delays.

5. Callers should be addressed as Mr., Mrs., Miss, or Ms., but not by their first names, unless they are personally known to the staff. Many people (nearly 20 percent in a recent survey) resent being addressed informally by unidentified medical office personnel.

6. Stress or work-related problems should not influence staff's treatment of patients. Patients understandably believe their problems are more important than how hard staff members think they are working. An unpleasant, curt, hostile, or hasty tone of voice on the telephone may be the caller's first—and last—impression of your office.

Staffing. Is your staff adequately trained and does it perform within the limits of state laws? The physician's office staff is an asset if those with patient contact have been adequately trained and oriented. Employers are responsible for the negligent actions of employees under the doctrine of respondent superior. Questions which are asked during a Claims Prevention Survey include:

1. Do aides perform only those duties permitted by law? Some states, like California, have specific laws which define what a registered nurse, licensed vocational nurse, physicians' assistant, nurse practitioner, technician, or medical assistant can and cannot do. Permitting an unlicensed aide to prescribe or refill medications, give medical advice, or perform medical procedures reserved for licensed or certified professionals may subject the physician to civil, criminal, and malpractice penalties. Moreover, insurance policies do not cover damages awarded for injuries resulting from illegal acts.

2. Are basic office policies and treatment protocols or guidelines set down in written form? Protocols should be developed for procedures which must be

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department, and Director of Special Projects, respectively.

done without variation, such as preparing specimens for the laboratory. Guidelines are more appropriate when flexibility, individual judgment, or patient needs allow staff to adapt basic rules, such as when taking histories.

3. Has the physician determined that aides have had adequate training and experience to perform specific duties? Absent licensure and certification, a physician may be responsible for making this determination and documenting on-the-job instruction.

Office Policies. Do patients understand office policies before a problem develops or a dispute arises? A physician's policies about fees, billing, special charges, restrictions on medication refills, referral to other physicians, and related issues should be explained to new patients. Otherwise, misunderstandings can interfere with the physician-patient relationship.

An effective way to explain office policies is in an inexpensive patient information pamphlet which includes: information about the physician(s); billing policies, such as added charges for completing insurance forms, notice that laboratory, x-ray, and consultants' charges are not included in statements, policies concerning advance payments, installment payments, acceptance or nonacceptance of insurance assignments, and policy on unpaid accounts; what the patient should do in an emergency if the physician is not available; information about on-call coverage; and specific information about the patient's responsibilities in the physician-patient relationship.

Patient Questionnaires. Does the physician read the forms patients are required to complete? Many physicians use health history questionnaires to assist in an initial assessment. These forms can be very useful. When improperly or carelessly used, the forms become a malpractice hazard. Forms are most helpful when: 1. All spaces for information are filled or voided. A blank space next to questions about allergies, medications, and past medical problems, could mean that the patient did not know, could not remember, or could not spell the term. 2. Names of current and prior physicians and reasons for seeing them are requested. Current medications, including over-the-counter drugs, are recorded. Physicians should review forms the patient completes at the physician's request. Physicians are advised to pay special attention to entries which suggest the need for followup.

Patients often list their chief complaints on such forms, but then forget to mention all of them when they see the physician. If a patient indicates he suffers from a chronic disease, but denies seeing another physician or taking medication, the history may be inaccurate or overstated. Similarly, when a patient reports he sees an orthopedist for back pain, an ear, nose, and throat physician for allergy, or a psychiatrist for depression, but denies taking medication, it is advisable to question that individual further. He or she may have inadvertently omitted the information.

Physicians should address all inconsistencies and inaccuracies in any information a patient provides. On completion of the review, the physician should initial the form to indicate it has been considered.

Referred Patients. Do patients understand why they have been referred to a physician or why they are being

referred to another one? Physicians who accept patients on referral should insist on receiving adequate clinical information from the referring physicians. Surgeons and other specialists may want copies of past medical records or relevant portions of the hospital chart in order to have more information than customarily is provided informally over the telephone (and often not documented). Some physicians use a referral form which indicates, in addition to the reasons for the referral and pertinent medical history, the referring physician's specific requests for examination, treatment, or followup. A physician should explain to a patient the reasons for a referral. (*Medical Liability Monitor—Loss Minimizer*, November and December 1987. *Loss Minimizer's* author is David Karp, San Rafael, CA, a professional liability claims consultant.)

PHYSICIAN'S ASSISTANT CONVICTED OF CRIMINAL CHARGES

The conviction of a physician's assistant for conspiracy to distribute controlled substances, distributing controlled substances, and attempting to evade income taxes should be affirmed, a federal appellate court for Kansas ruled. The physician's assistant allegedly masqueraded as a physician at a clinic and prescribed drugs to patients using his employer's DEA number. He allegedly called in false prescriptions to local pharmacies, sent runners to pick up the drugs, and then used those drugs for illegal street sales. The government showed he earned approximately \$21,000 in 1979 and \$23,000 in 1980 from his illegal drug activity. He failed to report those amounts as income on his federal income tax returns. Affirming his conviction, the court said that even if some of the prescriptions may have been for valid medical reasons, his conviction should stand because he was not a physician and was not registered with the DEA. The court affirmed his conviction on the other counts as well. (*The Citation*, October 1, 1987, Volume 55, No. 12)

VIRGINIA'S CEILING UNCONSTITUTIONAL

The federal trial court which held unconstitutional Virginia's \$1 million ceiling on the recovery of damages has refused the state's request for reconsideration of the decision on *Boyd versus Bulala*. The court's original opinion, rendered in November 1986, construed the Seventh Amendment to provide plaintiffs in federal court the right to have a jury determine the amount of damages without limitation. Because the seventh amendment does not clearly apply to litigants in state courts, the federal judge went on to interpret Virginia's Constitution to extend the same guarantee. Virginia's own Supreme Court has not yet ruled on the constitutionality of the law, and the state's lower court decisions are split.

The underlying case involved severe neurological injuries sustained by a newborn as the result of the failure to perform a timely delivery. The \$8.3 million recovery included \$2 million in punitive damages and a \$1.7 million award to the infant's parents for "past and future medical costs until [the infant plaintiff] reaches 18 years of age," which the court refused to reduce even though the infant died six weeks after the trial.

A better alternative for hypertensives who are going bananas...

Spare your patients the extra cost—
in calories, sodium and dollars.

Spare your patients the rigors of
dietary K⁺ supplementation.

DYAZIDE[®]

25mg Hydrochlorothiazide/50mg Triamterene/SKF

Effective antihypertensive* therapy...without the bananas

DAW
'DYAZIDE' AS WRITTEN.

* Not for initial therapy. See brief summary

Before prescribing, see complete
prescribing information in
SK&F CO. literature or PDR.
The following is a brief summary.

WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or

without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin [ACTH]). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The

following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth, anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak™ unit-of-use bottles of 100.

PROFESSIONAL LIABILITY

a turn for the better

New Jersey has eliminated one of the most costly inequities in our tort system... paying claimant twice for the same injury in many cases. Changing the "collateral source rule" has been a major priority of the Medical Inter-Insurance Exchange in its efforts to reform the medical malpractice legal system. The Exchange provided the initiative and leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. It will moderate the ever-increasing severity of insurance losses. A significant victory... but only one step in the Exchange's continuing battle to relieve physicians of unfair burdens.

LEADERSHIP IN SUPPORT OF MEDICINE

THE NATIONAL BOXING SAFETY CENTER

MAX M. NOVICH, M.D., PERTH AMBOY*

Historically, New Jersey has been linked to boxing at all levels and has developed many champions.

The first million-dollar boxing gate was held at Boyles' 30 acres in Jersey City on July 2, 1921, when Jack Dempsey knocked out George Carpentier of France in the fourth round and retained his heavyweight championship crown. "Two Ton" Tony Galento of Orange, was a colorful boxer. Although short in stature and boxing finesse, he was full of unbelievable strength and courage. In his bout with the vaunted Joe Louis on June 22, 1939, he knocked Louis down to the floor in the second round; ultimately, Tony was knocked out by Louis in the fourth round. Jersey Joe Wolcott of Camden, former commissioner of boxing in New Jersey, had become world heavyweight champion when he defeated Ezzard Charles in the seventh round knockout on July 18, 1951, in Philadelphia. The list goes on and on with famous boxing names such as Rocky Graziano, Tony Zale, Ernie Schaaf, Don Petrin, Charles Fusari, and Sugar Ray Robinson. With the rejuvenation of professional boxing in Atlantic City, historic moments in boxing have taken place, i.e. the bout between Michael Spinks and Jerry Cooney.

THE PHYSICIAN IN BOXING

The first academic program on the medical aspects of boxing was held at UMDNJ-New Jersey Medical School on October 13, 1979, and has been followed by more boxing symposiums.¹⁻⁴

Because the medical profession so intimately is involved in boxing and because of recent bad press about boxing, the public has demanded boxing to be made safe. This appeared to be an opportune time to counteract the official position of the AMA, which was to abolish boxing.

In Las Vegas in January 1971, I founded the Association of Ringside Physicians for amateur boxing, which was incorporated in the State of New York on May 6, 1971, to ensure that amateur boxers in the United States and members of U.S. teams in foreign competition would be handled by U.S. physicians. The Association now is administered by the Sports Medicine Committee of the USA/Amateur Boxing Federation.

THE NATIONAL BOXING SAFETY CENTER

With the help of several key hospital administrative personnel and the blessings of the President and Chief Executive Officer, 16 physicians and a dentist organized the National Boxing Safety Center of the United Hospitals of Newark. The Medical Board is composed of specialists and an advisory panel of experts

including: an announcer, attorney, businessman, cutman, managers, marketing specialist, Newark City Councilman, physical educators, promoters, former championship contender, former U.S. Congressman, public relations expert, sports editor, sports psychologist, sports writer, and trainers. The Board has handled about 265 boxers; two have been disqualified for cardiac conditions, one for a detached retina, and one for blood dyscrasia.

The goals of the National Boxing Safety Center are:

- ★ To prevent unnecessary injuries with a multidisciplinary preflight examination determining whether a boxer is fit to box.

- ★ To assure boxing safety in the ring, an ongoing series of educational seminars for boxers, trainers, referees, and allied health personnel will be provided to enhance their ability to assure a contestant's fitness to box.

- ★ To provide followup care after every bout to determine if a boxer has sustained injuries; all boxers in the National Boxing Safety Center Program will be examined for injuries postfight.

- ★ To conduct research into the nature of boxing injuries in order to lessen their recurrence.

- ★ To make recommendations to governing bodies concerning administrative changes which would reduce boxing injuries and deaths in the ring.

CLINIC SERVICES

The Center's Clinic offers a battery of multidisciplinary medical tests to enable a physician to determine whether or not a boxer is medically fit to box professionally.^{5,6} These tests enable our physicians to identify existing problems in an applicant which might lead to an injury; the tests include: history and physical examinations; electrocardiogram, electroencephalogram, x-rays of the chest; laboratory examinations (CBC, blood type, blood chemistry, sickle-cell screening, VDRL, and urinalysis); eye examinations by our certified ophthalmologist; and neurological examinations. All results from laboratory and clinical examinations are listed on the form provided by the New Jersey State Athletic Commission.

Should any of these medical tests show an abnormality that might preclude a boxer from obtaining a license, the boxer is referred to a staff member for consultation. This consultant decides if this abnormality is valid or invalid. The medical examiner

*Dr. Novich is Founder of the Sports Medicine Program at UMDNJ and the United Hospitals Orthopedic Center; he is Clinical Professor of Surgery, UMDNJ-New Jersey Medical School, Newark. Correspondence may be addressed to Dr. Novich, 313 State Street, Perth Amboy, NJ 08861.

COVER STORY

then comments to the New Jersey State Athletic Commission as to whether or not the boxer applicant in question is medically fit to box professionally.

The response of our consultants has been most gratifying; they are sympathetic to boxers and to the sport of boxing, and the boxers are pleased that our physicians show such interest and concern. Our clinic is served by medical and nursing staffs and support systems including supervisors and administrative and public relations personnel.

In addition, we have a resident staff of orthopedic physicians who are being trained in sports medicine, the medical aspects of boxing, and the sport of boxing. This probably is the only such training program in the country. Managers and trainers visit the facilities to ask medical questions about their charges. Clinic fees are charged, and no boxer is turned away because of lack of funds.

THE NEW JERSEY STATE ATHLETIC COMMISSION

The State Athletic Commission has a responsibility to ensure the safety and welfare of boxers as follows:

- The Commission licenses boxers to assure that they are medically fit to box professionally.
- The Commission licenses and assigns referees, promoters, inspectors, seconds, and matchmakers.
- The Commission assigns licensed ringside physicians and a second physician in the dressing room. Postbout examinations are conducted by physicians; and, if necessary, treatment is performed by the physician in the dressing room or the boxer is referred to a local hospital emergency room.
- Inspectors oversee how handwraps and gloves are applied on a boxer in the dressing room. It is their duty to observe what methods seconds use to freshen boxers between rounds. Assigned inspectors are encouraged to go to gymnasiums to determine whether boxers are following appropriate pre-bout fitness and training routines. They also should attempt to detect training injuries which may be hidden from the physician at pre-bout examinations; to date, no such preliminary inspections have ever been sanctioned by state commissions.
- The Commission requires bonding of promoters and managers, termination of options, and monopoly of a boxer by a promoter, as recommended by the American Association for the Improvement of Boxing.⁷

TRAINING AND CONDITIONING

Boxing is an individualistic combative sport requiring courage and skills not possessed by the average male. The boxer must prepare himself with a thorough hardening and toughening process which takes years. It is this hardening of his body that will help prevent most injuries from the blows he will have to endure.

The modern concepts of exercise physiology were used by trainers of yesteryear: the trainers developed many of the concepts through trial and error. Strength, speed, and stamina are developed by the physiologic overload principle, which utilizes graduated muscular exercises and interval training.

Interval training builds speed and endurance by overloading an athlete through aerobic and anaerobic exercises which develop a high oxygen debt. A quick recovery of the cardiovascular and respiratory system is sought and expected. Weight training for conditioning requires exercises that will develop muscular power and muscular endurance. Interval training is developed progressively in each boxer. While the boxer is being conditioned, the trainer teaches him offensive and defensive boxing skills. As a rule of thumb, 15 rounds of daily training are required for each round of a projected bout.

Roadwork, the single best conditioner in the boxer's training program, involves jogging three to five miles daily to develop stamina and endurance. A boxer usually does his roadwork in the morning before breakfast. Most boxers break up the roadwork with footwork by moving the hands, arms, and trunk simultaneously.

A training boxer must spar with adversaries. Candidates for boxing are introduced to the basic elements of position, punching, offense, and defense. Then the boxer learns how to deliver the blow, while at the same time protecting himself from his opponent's counterblows. Hundreds of hours of hands-on instruction are required.

Gym work includes heavy and small bag punching. The heavy bag develops leverage of the boxer's punch and muscle control, and its resistance increases the size and strength of muscles of the shoulders and upper extremities. Punching the small bag develops speed, rhythm, timing, coordination, and strength to keep hands high. Rope-jumping (skipping) is an excellent cardiovascular, respiratory, and aerobic conditioner. This exercise prevents muscle stiffening and helps develop endurance. Gym work also employs calisthenics for stretching and flexibility, and shadow boxing entailing offensive and defensive moves in front of a full-sized mirror or in the ring.

A boxer's trainer must understand nutrition and be able to impart this information to the boxer. In addition, he must be aware of the protein myth, carbohydrate loading, and the importance of water and electrolyte balance.

A TYPICAL WORKOUT

The workout starts in the afternoon with an exercise to limber muscles and joints. All parts of the musculoskeletal system (including the neck, shoulders, trunk, and upper and lower extremities) systematically are put through a normal range of motion. The cardiovascular and respiratory systems are exercised for two or three rounds, and the boxer experiences slight diaphoresis. This exercise tones the musculoskeletal system while increasing the heart rate. A shadow boxing routine usually follows, and then a session of sparring with a partner begins. Instructions by the trainer are given during the end of each round. The session is concluded by floorwork (calisthenics) to strengthen abdominal muscles (sit-ups), the neck (bridging), and the legs (bicycling).

COVER STORY

THE HAZARDS OF BOXING

Kaplan reported that, despite the many punches thrown in a boxing bout, only about ten pivotal punches may land.⁸ Most blows miss, or are deflected, blocked, or parried. A punch that is not seen causes the most damage. Deaths in the ring are few and considerably less than in other sports.⁹ In boxing, there are 0.13 deaths per 1,000 participants, compared to 0.3 deaths in college football; 0.7 deaths in motorcycle racing; 1.1 deaths in scuba diving; 5.1 deaths in mountaineering; 5.6 deaths in hang-gliding; 12.3 deaths in sky diving; and 12.8 deaths in horse racing. Catastrophic paraplegia and quadriplegia occur in football, but never are seen in boxing. Since 1904, with the rebirth of the modern Olympics, there never has been a death or serious injury in Olympic boxing. Although the public is entitled to a good match and abhors a mismatch or tragedy in the ring, most ring deaths stem from administrative error.

The American Medical Association resolved to reduce brain injury in boxing; a panel of experts recommended changes in the present medical examinations and ringside coverage of boxers. This group included a cardiologist, general surgeon, neurologist, neurosurgeon, neuropathologist, neuroradiologist, and orthopedist. Only two members of this group had many years of actual ringside physician experience; the other physicians became acquainted with boxing by reading past and current national and foreign boxing literature. After 18 months of discussion, the physicians felt boxing should not be outlawed. They sponsored a successful educational conference on February 19, 1983, entitled, "The Medical Aspects of Boxing," in affiliation with the Association of Ringside Physicians.

The past 25 years have seen tremendous growth in sports medicine knowledge. Only recently has the boxing profession started to use these concepts. Some safety measures, such as the thumbless glove, have been used to reduce the incidence of retinal detachments and other eye injuries. Research on a mouthpiece to afford dental protection, to make breathing easier, and to provide more oxygen for fatigued muscles is being pursued.^{10,11} Hopefully, this new mouthpiece also will reduce the punching power to the brain and lessen knockouts.

Mismatches never should occur. A ringside physician should be authorized to stop a bout and de-

termine the competence of a boxer as he sees the match unfold. Physicians, referees, and judges should attend medical symposia and seminars to better acquaint them with injuries, knockdowns, and knockouts. The referee and ringside physician should have prearranged voice and hand signals so a doctor is called immediately when a boxer is in trouble.

The American Academy of Neurological and Orthopaedic Medicine and Surgery board certification for ringside physicians is a giant step in the right direction for reducing injuries and making boxing safer.

CONCLUSION

John Branca, former Commissioner of the New York State Athletic Commission, stated that there has to be professionalization of the boxing profession in the United States,¹² which can be executed as follows:

1. Congress must establish a regulatory agency professionally staffed with those meeting civil service qualifications, and adequately financed so that the mandates, regulations, and rules can be effectively and efficiently administered. The office staff must be qualified by education, training, and experience; to have been involved in boxing is not enough.

2. The National Boxing Commission must be vested with the sole direction, management, control, and jurisdiction over boxing and related activities.

3. All persons involved with boxing—corporations, promoters, referees, judges, matchmakers, timekeepers, box office employees, ticket takers, inspectors, doormen, ushers, professional boxers, their managers, trainers, seconds, sparring mates, announcers, gym owners, operators, and special police—must be licensed.

4. The national body must establish rules, regulations, and standards for all individuals involved in the boxing profession. All applicants must complete a personal application form and submit to fingerprinting, which will be on file with the National and State Boxing Commission. The National or Local Boxing Commission must provide training courses, medical seminars, and boxing safety conferences and require mandatory attendance for license approval and renewal.

5. The Commission must establish requirements for each job classification, including trainers, managers, judges, seconds, promoters, and boxers.

...like the more than one million patients who have received **INDERAL® LA**.

In a recent survey, 4,120 participating physicians gave us their views¹ on **INDERAL LA** in the treatment of hypertension, angina and migraine.

INDERAL LA is their preferred beta blocker

...of the nearly three out of four physicians responding to the questionnaire, an impressive 97% rated **INDERAL LA** good to excellent for overall performance. Virtually all cited efficacy, tolerability, long-term cardiovascular protection and once-daily convenience as important factors in their choosing to prescribe **INDERAL LA**.

INDERAL LA promotes patient compliance

...Virtually every responding physician rated patient satisfaction with **INDERAL LA** to be as good as, or better than, other beta blockers.

Like conventional **INDERAL** Tablets, **INDERAL LA** should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree and bronchial asthma.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION, SEE PACKAGE CIRCULAR.)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. INDERAL LA is formulated to provide a sustained release of propranolol hydrochloride. INDERAL LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. INDERAL is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by INDERAL, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

INDERAL LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with INDERAL LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of INDERAL Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

INDERAL LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to INDERAL LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, INDERAL LA has been therapeutically equivalent to the same mg dose of conventional INDERAL as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure, and rate pressure product. INDERAL LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. **Hypertension:** INDERAL LA is indicated in the management of hypertension; it may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. INDERAL LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: INDERAL LA is indicated for the long-term management of patients with angina pectoris.

Migraine: INDERAL LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: INDERAL LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. INDERAL LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. INDERAL is contraindicated in 1) cardiogenic shock; 2) sinus bradycardia and greater than first-degree block; 3) bronchial asthma; 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with INDERAL.

WARNINGS. **CARDIAC FAILURE:** Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or INDERAL should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of INDERAL therapy. Therefore, when discontinuance of INDERAL is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If INDERAL therapy is interrupted and exacerbation of angina occurs, it usually is advisable to reinstitute INDERAL therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema)—PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. INDERAL should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY: The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

INDERAL (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOGLYCEMIA: Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS: Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T₄ and reverse T₃, and decreasing T₃.

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. **GENERAL:** Propranolol should be used with caution in patients with impaired hepatic or renal function. INDERAL (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should be told that INDERAL may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS: Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS: Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if INDERAL (propranolol HCl) is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncopal attacks, or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium-channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure, or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenytin, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T₃ concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY: Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY: Pregnancy Category C. INDERAL has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. INDERAL should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS: INDERAL is excreted in human milk. Caution should be exercised when INDERAL is administered to a nursing woman.

PEDIATRIC USE: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular: Bradycardia; congestive heart failure; intensification of AV block; hypotension; paresthesia of hands; thrombocytopenic purpura; arterial insufficiency, usually of the Raynaud type.

Central Nervous System: Light-headedness; mental depression manifested by insomnia, lassitude, weakness, fatigue; reversible mental depression progressing to cataplexy; visual disturbances; hallucinations; vivid dreams; an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy, and vivid dreams appear dose related.

Gastrointestinal: Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic: Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory: Bronchospasm.

Hematologic: Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-Immune: In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous: Alopecia, LE-like reactions, psoriasisiform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (practolol) have not been associated with propranolol.

DOSAGE AND ADMINISTRATION. INDERAL LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from INDERAL Tablets to INDERAL LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. INDERAL LA should not be considered a simple mg-for-mg substitute for INDERAL. INDERAL LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION—Dosage must be individualized. The usual initial dosage is 80 mg INDERAL LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS—Dosage must be individualized. Starting with 80 mg INDERAL LA once daily dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE—Dosage must be individualized. The initial oral dose is 80 mg INDERAL LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, INDERAL LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS—80-160 mg INDERAL LA once daily.

PEDIATRIC DOSAGE—At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

CORONARY ARTERY DISEASE IN A YOUNG WOMAN WITH SLE

BRUCE J. HAIK, M.D., AND JACOB I. HAFT, M.D., NEWARK*

Chest pain in a young female with systemic lupus erythematosus (SLE) usually is due to pericarditis or pleurisy. Our 30-year-old patient with SLE and chest pain was found to have severe coronary disease on coronary arteriography. Occlusive coronary artery disease commonly occurs in young patients with SLE.

Chest pain in young women with systemic lupus erythematosus (SLE) usually is due to pericarditis or pleurisy.¹⁻³ Occasionally, however, the pain is due to myocardial ischemia and significant coronary atherosclerosis is found on arteriography or at post-mortem examination.¹⁻⁵ We present a report of a 30-year-old female patient with angina and extensive coronary occlusive disease, as shown by coronary angiography, to draw attention to the recent appreciation of the fact that coronary atherosclerosis occurs frequently in young patients with SLE, and should be suspected as a cause for chest pain in patients with SLE.¹⁻³

CASE REPORT

A 30-year-old woman was admitted to Saint Michael's Medical Center for elective coronary arteriography. Fifteen years earlier, she was diagnosed with SLE manifested by an acute systemic illness with fever, fatigue, facial rash, arthritis, and renal insufficiency. After serologic confirmation of the diagnosis, she was placed on maintenance prednisone therapy, but an exacerbation occurred with nephrotic syndrome and hyperlipidemia. Two renal biopsies showed membranous nephritis and proliferative nephritis, respectively. The patient developed hypertension, which was controlled with diet, but nine months prior to hospitalization, she experienced retrosternal tightness with radiation to

both arms which was precipitated by moderate activity and exposure to cold weather. Her pain lasted 15 to 30 minutes and sometimes was associated with shortness of breath, palpitations, and diaphoresis, but she denied paroxysmal nocturnal dyspnea, orthopnea, or pedal edema. Over the past two months, the symptoms increased in frequency and severity. A thallium stress test revealed a fixed defect in the posterior and inferior left ventricle walls after exercising for 5 minutes and 12 seconds. The patient stopped because of fatigue, but there was no chest pain or electrocardiographic changes of ischemia. She was admitted for coronary angiography.

In 1979, the patient had small bowel gangrene secondary to an arterial embolus and underwent small bowel resection. The postoperative course was complicated by acute renal failure and respiratory insufficiency requiring temporary hemodialysis and tracheostomy. She underwent total hysterectomy and bilateral oophorectomy because of menorrhagia in 1983. The patient's mother died of a myocardial infarction at the age of 44. There was no history of ethanol abuse;

*Drs. Haik and Haft are affiliated with the Department of Cardiology, Saint Michael's Medical Center, Newark. Correspondence may be addressed to Dr. Haft, Saint Michael's Medical Center, 268 Martin Luther King Jr. Blvd., Newark, NJ 07102.

however, she has smoked two packs of cigarettes per day for approximately 15 years.

Examination revealed a moderately obese female in no distress. The temperature was 98.8°, pulse was 80 and regular, and respirations were 16. Blood pressure was 110/70. No rash or lymphadenopathy was present. The carotid pulses were normal without bruits. The lungs were clear. The point of maximum impulse was displaced laterally and the heart sounds were normal without murmurs, gallops, or rub. The abdomen was negative and the extremities were without cyanosis or edema. Peripheral pulses were present and equal bilaterally. Urinalysis was negative. The Hgb and Hct were 13.3 gm/dl and 39.5 percent with a platelet count of 292,000 and WBC of 3,700. The BUN was 9 mg/dl, creatinine was 0.6 mg/dl, glucose 109 mg/dl; electrolytes were normal. The serum cholesterol was 276 mg/dl.

An electrocardiogram showed normal sinus rhythm with an intraventricular conduction defect. Chest roentgenogram revealed an enlarged heart. Left heart catheterization and coronary arteriogram revealed akinesis of the inferior and posterolateral segments of the left ventricle with moderate to severe hypokinesis of the anterior and anterolateral segments. The left anterior descending artery had intraluminal disease throughout its course, with a large diagonal branch having an 85 percent narrowing shortly after its origin. The left circumflex artery revealed a 95 percent proximal narrowing and a large obtuse marginal branch had intraluminal disease. The right coronary artery had diffuse disease in its midportion and was totally occluded at its distal portion before the posterior descending artery (PDA). The PDA and posterolateral branches were filled via collaterals from the left coronary artery. Although surgery was considered, the patient preferred a trial with medication. She responded to diltiazem 30 mg four times a day and isosorbide dinitrate, 10 mg four times a day, and currently is being followed as an outpatient.

DISCUSSION

Systemic lupus erythematosus (SLE) can affect the heart in a number of ways.^{1,3} As part of the polyserositis associated with the disease, pericarditis is the most common cardiac manifestation.^{1,4} Pericardial effusion frequently is present, especially if investigation includes echocardiography, but only very rarely does tamponade occur.^{1,3} Myocarditis and a peculiar type of noninfective endocarditis with verrucous vegetations (Libman-Sacks endocarditis) are found frequently at autopsy but these forms of cardiac involvement rarely cause clinical problems.^{1,2,4} The myocardiopathy rarely causes cardiomegaly and heart failure, but these manifestations are difficult to separate from the effects of hypertension, anemia, or renal failure that frequently are associated with SLE.² Immune complexes in the myocardium have been reported by some investigators.⁵ Libman-Sacks-type vegetations rarely have been implicated as a cause of aortic or mitral insufficiency and rarely have resulted in emboli to the coronaries or other beds in the systemic arterial system.^{1,2} Conduction disturbances and arrhythmias, attributed to focal myocarditis or small vessel vasculitis, also have been reported.^{1,2}

Coronary artery disease was considered a rare complication of systemic lupus erythematosus until recently. In a report of 83 patients with lupus and a review of the literature to 1959, Shearn suggested that the occasional myocardial infarction seen at autopsy probably was due to vasculitis and that the atherosclerosis seen probably was incidental.⁶ Subsequently, a number of case reports of myocardial infarction in young patients with SLE began to appear⁷⁻⁹ and a different series of patients with the disease who had premature coronary atherosclerosis were reported.^{4,10-12} In 1975, Bulkley and Roberts reported 8 of 18 patients who received steroids for more than one year to have occlusive atherosclerosis in at least one coronary artery; 4 of the 8 patients had myocardial infarctions.⁴ None of the 17 patients treated with steroids for less than one year had coronary atherosclerosis. They hypothesized that accelerated atherosclerosis possibly was related to the higher incidence of hypertension seen in patients on steroids. A subsequent study from the National Heart Institute by Haider and Roberts found a similar incidence of occlusive coronary atherosclerosis with 10 of 22 autopsied patients having at least one of their major coronaries narrowed by greater than 75 percent.¹¹ The ages ranged from 18 to 36 years and 9 of the 10 patients were women. From the literature until 1985, Doherty and Siegel collected 33 cases of coronary artery disease in patients with SLE under age 35.² Twelve patients had definite atherosclerosis, 7 patients had coronary arteritis; the coronary artery disease in the others was not fully characterized. Badui found 16 percent of 100 female patients to have symptoms and signs of ischemic heart disease; 11 patients had electrocardiogram changes of transmural myocardial infarction.³ The patients were divided into two groups: patients thought to have coronary artery disease secondary to vasculitis, with angina associated with exacerbations of systemic lupus erythematosus activity elsewhere and responding to steroid therapy (5 patients), and patients with atherosclerosis, in whom steroids were not effective, who had disease of longer duration and who had no evidence of vasculitis elsewhere at times of increased angina activity (11 patients).

The incidence of coronary artery disease reported as a cause of death has varied. Rosner et al. reported myocardial infarction to have been the cause of death in 3 percent of 222 patients with systemic lupus erythematosus who died.¹³ Among a series of 29 such patients who died, Correia et al. reported 5 (17 percent) patients to have died of ischemic heart disease.¹⁴ Wallace et al. did not specifically identify coronary disease but noted that 25 percent of 82 patients with SLE in their series with nephritis and 30 percent of 46 patients without nephritis who died, had cardiovascular disease as the cause of death.¹⁵

The mechanism whereby young women with systemic lupus erythematosus develop coronary atherosclerosis remains unknown. Recent work has suggested that endothelial trauma may start a reparative process that leads to development of atherosclerotic plaques.¹⁶ The widespread arteritis of SLE erythematosus may damage the endothelium sufficiently to initiate this process even if the vasculitis is not severe enough to directly result in symptoms. Vasomotion also may play

a role in the etiology of atherosclerosis, with spasm causing endothelial damage. Vascular irritability and localized spasm, most notably Raynaud's phenomenon, is not uncommon in patients with SLE. Clotting abnormalities with hyper-reactive platelets also have been implicated as a cause of atherosclerosis. Antigen-antibody complexes and lupus-type anticoagulant, which is associated with a high incidence of thromboembolism, may make the young patient with SLE more prone to atherosclerotic coronary artery disease.¹⁷ In addition, these abnormalities may make the patient more sensitive to conventional risk factors such as smoking, high serum cholesterol, and hypertension, as was seen in our patient. The usual treatment with steroids may induce or worsen systemic hypertension.⁴

CONCLUSION

Although the mechanism remains obscure, atherosclerotic ischemic heart disease is not infrequently present in young patients with SLE; that diagnosis should be considered in patients with SLE with chest pain. As in our case, these patients may respond to conventional treatment for coronary artery disease.

We're putting lives back together.

As a physician you've probably seen it. A family's struggle against alcohol or drugs. A man or woman afraid to ask for help in dealing with depression. A young girl hiding an eating disorder behind a smiling face or popular personality.

At the Carrier Foundation, we work with physicians in treating troubled adolescents and adults. Unlike most general hospitals, all our resources are dedicated to this mission. And have been for more than seventy-five years.

Recognized by all major insurance companies, Carrier is a private, non-profit psychiatric hospital providing both inpatient and outpatient programs. Some of Carrier's specialized programs include: addiction recovery service, adolescent program, affective disorders program, behavioral therapy, eating disorders program, family therapy, geriatric program and women's program.

THE GENOGRAM'S CONTRIBUTION TO FAMILY-CENTERED CARE

JOHN ROGERS, M.D., M.P.H., AND PETER COHN, M.D., PISCATAWAY*

A community-based study of the family genogram documented that more family information is obtained by genograms than by routine histories. The genogram also was associated with changes in physician behavior, such as more frequent inquiries about family issues.

One of the markers of family-centered care is the extent to which family information is gathered from patients and applied to clinical problems. The family genogram (Figures 1 and 2) is an expanded pedigree tree and is promoted as an efficient tool for collecting, recording, and retrieving pertinent family information.¹ Despite its use in family practice residency programs, the genogram appears to be used infrequently by physicians in community practices.² One possible reason for this low utilization may be the lack of empirical data demonstrating that genograms provide physicians with more family information than routine family histories, and that the presence of any additional information influences clinical encounters. A study in an academic family practice center documented that for new patients, genogram interviews obtain much more information than routine unstructured family histories.³ To date, however, there has not been a similar study of the genogram in the community practice setting nor an investigation of the genogram's impact on clinical care.

This community-based study compares family information obtained by genograms with that obtained by physicians in their usual manner during patients' first visits to the practice. The primary hypothesis is that genograms will produce more information about more family members than the physicians' routine family

histories. The second purpose of the study is to determine if the genograms influence physicians' behaviors during these initial encounters with patients. The hypothesis is that genograms will increase the frequency of these physician behaviors: exploration of family issues, request for interviews with other family members, and offers or referrals for therapy for emotional problems.

METHODS

The site of the study was a rural community with a population of approximately 5,000 persons. Four independent practitioners (two family physicians and two general internists) participated in the project. All new patients over 16 years of age presenting to these physicians during July and August 1985 were eligible for the study. These initial doctor-patient encounters were systematically observed by one of the investigators after training and standardization of the data collection forms. The observer recorded each patient's demographic information and chief complaint, and noted whether the physician explored a family problem

*John Rogers, M.D., M.P.H., was affiliated with the Department of Family Medicine, UMDNJ-Robert Wood Johnson Medical School. or issue, requested interviews with other family members, suggested or offered counseling, or referred the patient for counseling. The observer also recorded whether the physician explored any job issue as an indicator of the physician's general inquiry about patients' social environments. The operational definition of "exploring an issue" was at least two questions about the same problem or issue. The observer also recorded any family information obtained by the physicians on a genogram recording form.

These data forms were completed for several routine first visits to each participating physician before the

introduction of the family genogram into the clinical encounters. After these baseline visits, the new patients completed self-administered genograms with assistance in the waiting room prior to the visit with the physician. These patients were divided into two groups: 1) feedback group—physicians received the genograms just before entering the examination room and 2) no feedback group—the genograms were placed in patients' records after the visits were completed. The assignment to the feedback and no feedback groups was done on an alternating basis without replacement for refusal to participate in the study.

Female	11	10	10

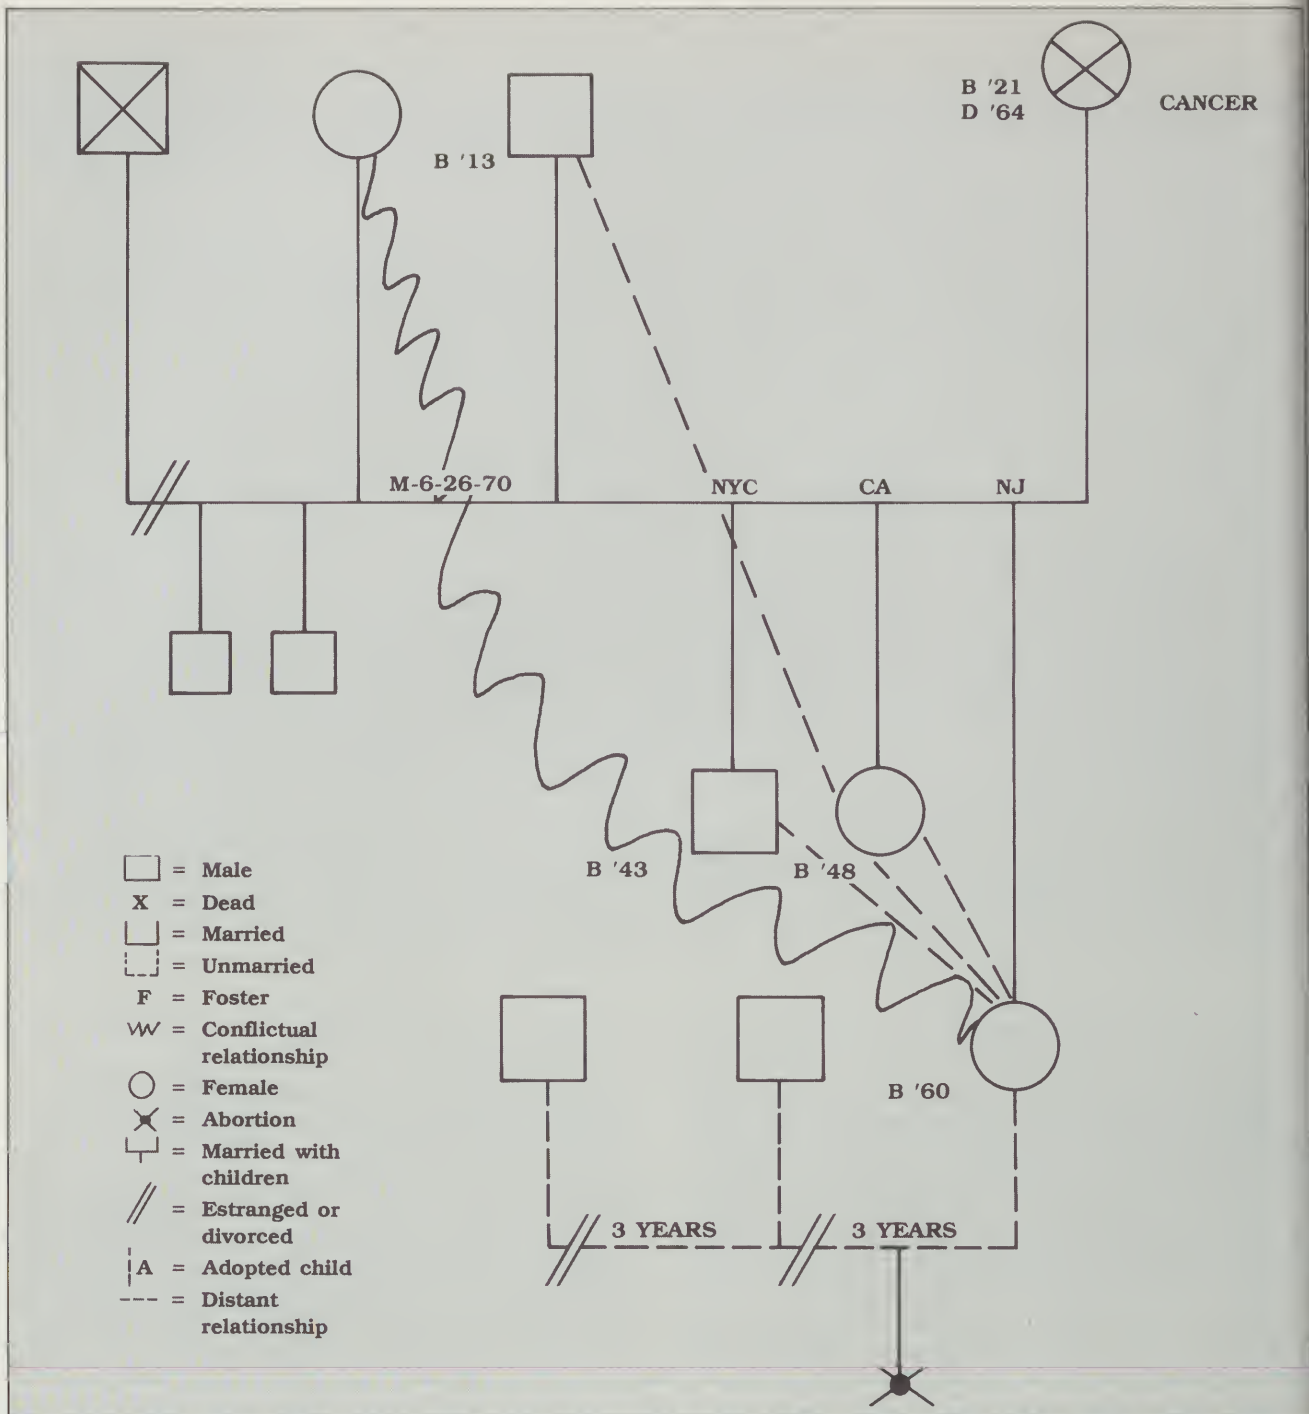

Figure 2—Brief genogram of patient with chronic pelvic pain. Note that her mother died when she was 4 years old, she is emotionally isolated from her family, and she has had two failed long-term relationships and one elective abortion.

The genogram recording forms were the same for the baseline visits and the genogram visits (feedback and no feedback groups). These forms were reviewed to determine how frequently different categories of family information were available to the physicians. Four types of information were included in the analysis: 1) family structure, number of generations for which information was available; 2) life events, major family stresses experienced by patient; 3) repetitive patterns, familial and genetic disorders; and 4) current household, current members and character of relationships.⁴ For "family structure," a generation was counted as present if there was at least one piece of information about at least one member on the genogram recording

form. A "life event" was noted as present if there was any indication that the identified patient had experienced marital separation or divorce, the birth of a child, or the death of a parent, sibling, child, or spouse. Credit for "repetitive patterns" was given if at least one appropriate biomedical or psychosocial problem was noted for any family member on the genogram. Information about the "current household" was counted as present if the membership of the household was noted on the genogram form or if the character of a relationship involving the patient or another household member was noted on the recording form.

The major comparisons were made between the baseline and genogram visits with secondary analysis

involving the feedback and no feedback groups of the genogram visits. The comparisons were made on the four categories of genogram information and the physician behaviors observed during the encounters. The Chi square test of significance with Yate's correction was used for these categorical variables. A *P*-value of .10 or less was considered significant due to the exploratory nature of this psychosocial research.

RESULTS

Seventy-two of the 83 patients approached for the study agreed to participate. Seven of the patients were accompanied by other family members during the

visit, but these patients were evenly distributed among the three study groups. The age and sex distributions among the three study groups were comparable as well (Table 1). The reasons for the patients' visits are outlined in Table 2 and were evenly distributed among the three study groups.

Review of the family genogram data forms documented that the genograms (feedback and no feedback visits) captured more family information than normally obtained by the physicians (baseline visits) (Table 3). For nearly one-fourth of the baseline visits, no information about any family member was obtained by the physicians' unstructured family histories, and for 50 percent of these visits, the family information was limited to one or two generations. In contrast, 90 percent of the genogram histories included information about three or four generations of the family. Life events experienced by the patients also were identified more frequently during genogram visits than during baseline visits. In particular, divorce or separation of the patient was identified five times as frequently at genogram visits, birth of a child was identified 50 percent more frequently, and death of an immediate family member was identified nearly twice as frequently. The genograms identified biomedical problems among family members 94 percent of the time; whereas, the physicians' routine histories noted biomedical problems only 45 percent of the time. The routine histories did not detect any psychosocial problems among family members, but over 20 percent of the genograms noted a psychosocial problem in at least one family member. The patients reported psy-

chosocial problems for themselves three times as frequently during genogram visits than baseline visits. Finally, household membership was noted during 36 percent of baseline visits and 82 percent of genogram visits, and the character of at least one family relationship was determined at one-fifth of the genogram visits but only one-eleventh of the baseline visits. It is noteworthy that the two genogram groups are very similar on detection of all categories of family information, especially life events and repetitive patterns (Table 4).

With regard to the second purpose of the study, family issues were explored during 32 percent of the genogram encounters and during 14 percent of the baseline encounters, but this trend was not statistically significant (Table 5). During the genogram-feedback visits, the physicians looked at 27 (93 percent) genograms and reviewed 15 (55 percent) genograms with the patients for clarification. However, there was no difference between the feedback and no feedback groups on the exploration of family issues at 31 and 33 percent of visits, respectively. Results for requesting interviews with other family members and exploring job

issues were similar with little difference between the feedback and no feedback groups but with an apparent increase of genogram over baseline encounters (Table 5). There were no suggestions, offers, or referrals for counseling noted during any of the study encounters.

DISCUSSION

To our knowledge, this is the first intervention trial of the genogram in the community setting. The study's major limitations are the rather small number of subjects, the use of a potentially biased observer for data collection, and the involvement of only four physicians. Some of the study's results are similar to those of other investigations of psychosocial issues in primary care, so this project may provide us with some useful lessons. For example, the rate of exploration of family issues in the genogram visits (32 percent of visits) is within the range noted by others (29 to 75 percent of visits).^{5,6} In addition, the lack of psychosocial counseling or referrals observed in this study is consistent with the low rates for these behaviors in primary care previously described by others (4 to 5 percent of visits).^{7,8}

Request Family Interview	0 (0%)	1 (3%)	2 (10%)
Explore Job Issue	1 (5%)	4 (14%)	5 (24%)

The study's first hypothesis that the genogram will produce more information about more family members than physicians' routine family histories was supported by the data. Information about three or four generations of family members was available at 90 percent of the genogram visits, but only 27 percent of the baseline visits. The genograms also identified major family stresses nearly twice as often as the routine histories. Even information about biomedical problems in family members was captured over twice as often by the genograms than by the routine histories. The ability of genograms to detect psychosocial problems in family members and the identified patient was superior to that of the routine histories as well. Finally, household membership and the character of family relationships were noted over twice as frequently for genogram visits than for baseline visits. An obvious alternative hypothesis to the study hypothesis is that the baseline visit patients were very different from the genogram visit patients on the prevalence of life events and repetitive patterns. The demographic similarity among the three study groups and the similarity between the two genogram groups (feedback and no feedback) on all family information categories argue against this alternative hypothesis. In addition, only the superior data gathering ability of the genogram over the routine history could account for the differences noted for the "family structure" and "household information" categories. The only other viable alternative to the study hypothesis is a systematic reporting bias by the observer. This threat to internal validity cannot be completely ruled out in this situation, but the substantial differences between genogram and baseline groups would require almost deliberate distortion during data collection. Hence, it is accepted that genograms gather more data than routine histories. This confirms a previous study conducted in a family practice residency program.³

The study's second hypothesis, that the genograms will lead to greater exploration of family issues, increased physician requests for interviews with family members; increased offers or referrals for therapy for emotional problems only partially was supported by nonsignificant trends. There were only three physician requests for interviews with other family members but no offers for referrals for therapy. These findings are not atypical for primary care encounters where interviews with other family members are rarely requested,⁵ mental problems are diagnosed half as often for new patients as compared with established patients,⁹ and psychosocial counseling referrals occur in less than 5 percent of encounters.^{7,8} The physicians did explore family issues more frequently during genogram visits than baseline visits, and the feedback and no feedback groups were equal on this outcome. It is of great interest that the physicians' behavior appeared to be

influenced regardless of whether they had the genogram in their possession during the visit or not. This result is similar to those of studies using the General Health Questionnaire (GHQ) as a psychosocial screening tool in that the feedback and no feedback groups were not different on the recognition and treatment—counseling, drugs, and referral—of mental problems.^{8,10} Unlike this study, the GHQ studies did not include baseline visits, so they could not compare the physicians' behavior during feedback visits and baseline visits before the intervention.

There are two possible explanations for the apparent change from baseline to no feedback visits: general changes in the physicians' behavior once the trial began or changes in the patients as a result of completing the genogram, which indirectly influenced the physicians' behavior. There is evidence supporting the general change in the physicians' concern with the patients' social environments as indicated by the modestly increased exploration of job issues during genogram visits. While there is no direct evidence support-

ing the possible explanation that the results are due to changes in the patients, research suggests how this may be feasible. Specifically, physician recognition of family difficulties has been shown to be related to patient attitude about the appropriateness of seeking help for psychosocial problems from primary care practitioners.¹¹ Completing genograms prior to seeing physicians may influence patients' attitudes about

the appropriateness of seeking psychosocial care from family physicians and general internists and thereby influence the doctor-patient relationship and the content of the clinical encounter. These possible explanations for the baseline—no feedback differences, i.e. changes in physicians or patients—cannot be excluded or accepted at this point in our understanding of the issues.

This community-based study has confirmed that the genogram makes more family information available to the participants of initial doctor-patient encounters than physicians' routine family histories and suggests that the genogram may influence the physicians' behaviors during those visits. Additional studies now are needed to determine whether the genogram improves the recognition and treatment of psychosocial problems, particularly family difficulties, and has any other beneficial impacts on clinical care. A fundamental tenet of family medicine is that family-centered care enhances physicians' "capacity to help."¹² This assertion or hypothesis must be tested by empirical research. The family genogram provides one standardized way of operationally defining family-centered care by categorizing the types of family information available to physicians during clinical encounters. The ways in which the family information is used in clinical decision making and influences clinical care

***The study showed that
genograms produce more

members than routine histories.
Genograms also identified major
life stresses nearly twice as
often as routine histories.***

then can be documented to address the basic research question, "Does family-centered care make a difference?" The use of the genogram in addressing this question appears to have merit and further research is warranted.

SUMMARY

Four primary care physicians and 72 patients participated in an intervention trial of the family genogram in a community setting. The results supported the first of the study's two hypotheses: genograms will produce more information about more family members than physicians' routine histories, and genograms will lead to increased physician exploration of family issues. In addition, the study demonstrated that the family genogram can be used to categorize the family information physicians may gather during clinical encounters and may use in their problem solving. In this way, the genogram provides a standardized way to operationally define family-centered care and thereby provides a method for empirically testing the fundamental family practice tenet that a family focus improves clinical care.

FROM LOOKING...TO LIVING...

to smiling again!

The rewards of Limbitrol

in moderate depression and anxiety:

- Rapid results—62% of total four-week improvement within a week versus 44% with amitriptyline¹
- Earlier relief of associated somatic complaints²
- Fewer dropouts due to side effects—only 1/3 the rate of those patients taking amitriptyline, although the incidence of side effects is comparable¹
- Fast improvement with less amitriptyline—1/3 to 1/2 the dose of patients taking amitriptyline alone³

Caution patients about the combined effects of Limbitrol with alcohol or other CNS depressants and about activities requiring complete mental alertness, such as operating machinery or driving a car. In general, limit dosage to the lowest effective amount in elderly patients.

SEE THE DIFFERENCE IN THE FIRST WEEK¹

Limbitrol[®] [®]

Tranquillizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety.

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use; then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction.

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients. (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Use in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to chlordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage; withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline; symptoms [including convulsions] similar to those of barbiturate withdrawal for chlordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs:

Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmic heart block, stroke.

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido.

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns.

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract.

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus.

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia.

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue.

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion.

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Overdose: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. I.V. administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime. Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly. Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher doses.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500; Tel-E-Dose[®] packages of 100; Prescription Paks of 50.

REVIEW: INFECTIOUS DISORDERS OF THE PAROTID GLAND

DAVID H. LOUGHRAN, D.O., AND LEON G. SMITH, M.D., NEWARK*

Infections of the parotid gland can be caused by many different organisms including bacteria, viruses, and mycobacteria. These entities must be identified and malignancy must be ruled out. Once the specific organism is identified, therapy may be instituted.

Parotid gland enlargement has many etiologies; therefore, the diagnosis and treatment represents a medical challenge. One must always consider malignancy in the differential diagnosis since 10 percent of patients with a parotid mass have this problem (Table).

In the early 20th century, postsurgical bacterial parotitis was a well-recognized entity, with surgical drainage as its sole therapy.¹ From the 1940s to the early 1950s, surgical parotitis was almost nonexistent as a result of antimicrobial agents. Prematurely, Robinson labeled surgical parotitis, "a vanishing disease"² only to see a resurgence of this entity in the 1950s and 1960s, probably due to the emergence of sulfonamide-resistant *Staphylococcus aureus* and the advanced ages of patients admitted for surgical treatment.

PYOGENIC PAROTITIS

Suppurative parotitis usually presents with sudden onset of swelling, pain, heat, tenderness, erythema,³ cervical adenitis, and trismus. Fever, leukocytosis, malaise, and sepsis also are common in this disease. Fluctuation may not be detectable because of the concealing effect of the dense surrounding parotid fascia.⁴ Purulent material may be seen draining from the parotid duct.

Pyogenic parotitis is more common in any chronic

debilitating condition, especially if dehydration and poor oral hygiene are present. Drugs used by the elderly, such as those for Parkinson's disease⁵ or diuretics⁶ predispose a person to parotitis by decreasing the flow of salivary secretions. In the absence of bacteriostatic mucous in the parotid ductal system and decreased flow, retrograde infection may develop.⁷ Other medications, such as antihistamines, tranquilizers, and antihypertensive agents⁸ also can predispose to xerostomia and parotitis.⁸ Decreased salivary flow and retrograde infection are associated with ductal obstruction caused by stones, connective tissue disease, trauma, mucous plugging, and oral carcinoma. The drying effect of atropine on the oral mucosa predisposes the surgical patient to acute pyogenic infection. The best prognostic factors are the premorbid condition of the patient prior to surgery and the pre-existing predisposing disease.

Pyogenic parotitis can result from hematogenous seeding during bacteremic episodes, which usually presents as a parotid swelling during or shortly after an episode of septicemia.

The most common organism associated with pyogenic parotitis is *Staphylococcus aureus*,⁹ but many

other bacteria have been reported including, *Streptococcus viridans*, hemolytic streptococci, *S. albus*, *S. pneumoniae* anaerobes, *Salmonella* sp, *Proteus* sp, *Pseudomonas* sp, and *Haemophilus influenzae*.

Infection begins in the larger ducts, destroys the ductal epithelium, and invades the remainder of the gland.¹⁰ This may lead to multiple abscesses, which

can coalesce and penetrate through the capsule, involving local tissue. Complications of pyogenic parotitis range from mild edema to fulminant glandular necrosis. Suppuration with and without osteomyelitis, fatal septicemia, facial nerve palsy, respiratory obstruction, and death are all sequelae of pyogenic salivary gland infection.³ Rupture through the floor of the external auditory canal, spontaneous drainage through the cheek, and extension to the face, neck, and mediastinum also have been reported by Spratt.⁷

The diagnostic evaluation requires a comprehensive history and physical examination. One must differentiate between enlarged parotid gland and local adenopathy and should attempt to palpate calculi and express pus from the parotid duct. Gram stain and culture of drainage from Stenson's duct or any other area of drainage can be of great value. X-rays of bony structures and soft tissue are needed to rule out osteomyelitis and calculi in the salivary ducts. Contrast sialography or probing of the duct may identify strictures or calculi. Radioisotopic scanning has been replaced by computerized tomography. Should a diagnosis prove elusive after this basic evaluation, biopsy with histology and culture should be performed. Laboratory technicians should perform gram stain and acid fast bacilli (AFB) smears and culture tissue for bacteria, virus, mycobacterium, and fungi.

In the preantibiotic era, mortality rates for acute parotitis ranged from 30 percent to 87 percent.^{1,2,11} Blair reported a 30 percent mortality in 1923 in a group of patients with bilateral parotitis treated without antimicrobials. Today's treatment with antimicrobials, nutrition, fluid management, and surgery has lowered mortality rates considerably.

Prior to the advent of antimicrobial agents treatment included radiation therapy, chewing gum, cannulation and irrigation of Stenson's duct, hot and cold packs, massage, and lemon drops⁷—all to no avail. Today, one should aim therapy at controlling pre-existing medical problems, provide adequate hydration, and discontinue all unessential medications. Failure to respond to medical therapy or development of fluctuation requires prompt drainage.

VIRAL PAROTITIS

Mumps (epidemic parotitis) is the most common viral disease affecting the parotid gland. The mumps virus is a member of the Paramyxoviridae¹² family which causes a systemic febrile illness with unilateral or bilateral nonsuppurative swelling and tenderness of the parotid gland. Prior to the advent of the mumps vaccine, epidemics occurred every two to five years,¹³ in January and May with 90 percent of those affected less than 14 years old.¹⁴

Within one day of the onset of fever, anorexia and malaise, earache, and parotid tenderness are present. Severe pain occurs during the period of rapid enlargement which reaches its maximum in two or three days. The gland is diffusely tender and swollen; the orifice of the parotid duct is erythematous and swollen, and exudes clear secretions.¹⁵ Extra-salivary gland manifestations include submaxillary adenitis, epididymo-orchitis, oophoritis, spinal fluid pleocytosis, meningitis, encephalitis, transient high-frequency deafness, and cardiac and renal abnormalities.

Diagnosis is aided by a history of exposure to mumps and by the clinical presentation. The white blood count either may be normal or reveal a mild lymphocytic leukopenia. Serologic studies or viral isolation may be of value when parotitis is recurrent or absent, a systemic illness occurs, or extra-salivary gland manifestations are present. Laboratory confirmation of mumps is not essential but is helpful, especially in adults; an increased serum amylase may be helpful.

The differential diagnosis of viral parotitis includes Coxsackie,¹⁶ mononucleosis,¹⁷ influenza A,¹⁸ lymphocytic-choriomeningitis virus,¹⁹ parainfluenza Type 3,^{20,21} parainfluenza Type 1, herpes simplex, cytomegalovirus, herpes zoster,¹⁵ and echo virus.²² These individual agents can be differentiated from mumps by serologic techniques or viral cultures.

Mycoplasma was described as a cause of parotitis.²³ Anderson pointed out the disease was demonstrated by acute and convalescent mycoplasma titers of 1:280 and 1:640, respectively.¹⁷ Mumps S and V titers were not elevated. The patient responded to treatment with tetracycline in six days.

Treatment of viral causes of parotitis is essentially symptomatic: analgesics and antipyretics, narcotic analgesics for severe orchitis, bed rest, and fluids. Intravenous fluids may be required for patients with severe vomiting or pancreatitis. Observation for complications such as hepatitis with cytomegalovirus or Epstein-Barr virus, and meningitis with herpes zoster virus, herpes simplex virus, mumps, cytomegalovirus, Epstein-Barr virus, and lymphocytic choriomeningitis, is essential.

GRANULOMATOUS PAROTITIS

The most common cause of granulomatous parotitis is *Mycobacterium tuberculosis* (M-TB). This specific parotid disease may or may not be associated with tuberculous pulmonary disease or with a positive tuberculous skin test. When classic findings of M-TB are present with a caseating granulomata and AFB, the diagnosis readily is made. When these findings are absent, the diagnosis is made by culture and a high degree of suspicion. Antituberculous medication is the mainstay of therapy; surgical intervention is indicated only if caseation necrosis occurs. In this case, complete surgical excision while the patient is under appropriate medication is necessary. Incision and drainage are not recommended at this point.²⁴ Tuberculous parotitis has many of the histologic features of sarcoid parotid disease; the presence of tuberculosis or sarcoidosis in other areas is as helpful as finding acid-fast organisms in the parotid tissue or culture.²⁵

Atypical acid-fast mycobacterium, causing infection of the parotid gland, has been described by Yarrington.²⁴ These infections are caused by scotochromogens and photochromogens. Because of their close associations with *Mycobacterium tuberculosis*, these infections can give a weekly positive PPD skin test, which may be diagnostically helpful.²⁴ Since these organisms are resistant to present antituberculous medication, complete surgical excision is necessary. This avoids the problem of fistula formation, often commonplace with incomplete excision. The new quinolones or rifampin-like compounds may be of some therapeutic value

in the future. Considering that *Mycobacterium avium intracellulare* (MAIC) is the most frequent organism recovered from the blood cultures of AIDS patients,²⁶ it will be interesting to see if the incidence of parotitis caused by atypical AFB increases in this group.

Actinomycosis also may cause chronic granulomatous disease of the parotid gland. Primary actinomycosis ascends from the mouth and usually involves the entire gland. If caused by a foreign body, it may involve only a portion of the gland. Secondary actinomycotic parotitis is due to infection from adjacent tissue, usually the cervicofacial actinomycosis.²⁷ Clinically, one sees chronic nodular induration with minimal to moderate pain. Fistulas draining yellow or white pus with yellow sulfur granules are common: erythema and induration of the orifice of Stensen's duct may be seen.

The diagnosis is established by positive cultures from pus or tissue, along with branching gram positive filaments and pin-head size sulfur crystals.

Actinomycotic parotitis is somewhat more stubborn than cervicofacial actinomycosis. It usually responds well to intravenous penicillin therapy for four to six weeks followed by 6 to 12 months of oral penicillin therapy. Surgery usually is not required. When used, however, surgery often is accompanied by complications.

Parotitis caused by cat-scratch disease is uncommon and can be difficult to differentiate from histiocytic malignancy, both clinically and histologically.²⁸ The disease usually presents with an enlargement of the regional lymph nodes, which drain the area of the inoculation site, with or without suppuration. Fever, rash, osteolytic bone disease, and neurologic manifestations have been described. The history of exposure to cats and a clinical picture consistent with cat-scratch disease are essential for an accurate diagnosis, but one must exclude all other diseases to be certain. The diagnosis can be supported by the demonstration of bacilli on Warthin-Starry silver stain. The skin test antigen is not commercially available at this time. Acid-fast bacilli smears, gram stain, and culture are essential to rule out tuberculous disease. This disorder is self-limiting and requires only careful observation. Surgical intervention is indicated only to rule out malignancy.

Blatt has reported granulomatous parotitis associated with *Francisella tularensis*.³⁰ Ulceration at the site of inoculation, as well as systemic manifestations of the infection, usually are present. Systemic manifestations consist of fever, chills, and malaise. A history of exposure to rabbit, tick bite, or exposure to other wild animals is extremely helpful. Diagnostic tools include cultures, agglutination titers, and skin tests. Other rare granulomatous diseases of the parotid gland are caused by rhinosporidiosis,³¹ brucellosis,³² histoplasmosis, and Hansen's disease²⁴ in the appropriate geographical areas. Syphilis always should be considered in the differential diagnosis of neck masses.³³

NONINFECTIOUS, BENIGN DISEASES

Other benign noninfectious causes of parotid enlargement include connective tissue diseases, metabolic and allergic disorders, Sjögren's syndrome,³⁴ lupus,³⁵ Mikulicz's disease,³⁶ Kimura's disease,³⁷ and sarcoid-

osis.^{38,39} Parotid enlargement due to alcoholism,⁴⁰ liver disease,⁴¹ diabetes,⁴² malnutrition,⁴³ iodine,⁴⁴ chronic lead ingestion, hypothyroidism, Cushing's syndrome, hyperuricemia, cystic fibrosis,⁴⁵ and hyperlipoproteinemia⁴⁶ must be ruled out. Allergic parotitis⁴⁷ and hypersensitivity reactions⁴⁸ are well described, including reactions to commonly used medications such as sulfa compounds⁴⁷ and phenylbutazone.⁵⁰ Parotid swelling, secondary to mechanical causes such as ductal obstruction caused by calculi or ill-fitting dentures⁵¹ also should be considered. An unusual consideration is the association of parotitis in patients who have a known history of some sort of forceful blowing. The entity of wind parotitis⁵² was described by Saunders after encountering four patients who played wind instruments or who had forcefully blown up heavy balloons.

**Kidney stones show up in
some hard-to-reach places.**

**Luckily, the New Jersey
Kidney Stone
Treatment Center
is easy to get to.**

You shouldn't have to go out of your way for lithotripsy services to complement your practice.

The New Jersey Kidney Stone Treatment Center is centrally located in New Brunswick, New Jersey, near statewide highways, for easy access for you and your patients.

The Center is equipped with the latest Dornier HM4 "tubless" lithotripter, which eliminates the need for a water bath. That means easier patient handling, and greater patient comfort.

And the Center is located at a major academic medical center, with full medical back-up. Patients are treated on an outpatient or inpatient basis.

Any board-eligible or board-certified urologist who has completed the ESWL training course and is licensed in the State of New Jersey may apply for privileges at the Center.

Physicians may also refer their patients to the Center for treatment by a member of our medical staff. After the procedure, patients are referred back to their own urologists for follow-up care.

For a credentialing package, or for more information about lithotripsy, call Center Director Diane DiGiulio at 1-800-542-8887, 8 a.m.-5 p.m., Monday-Friday.

New Jersey Kidney Stone Treatment Center

Located at Robert Wood Johnson University Hospital
One Robert Wood Johnson Place
New Brunswick, New Jersey 08901

The New Jersey Kidney Stone Treatment Center is operated by Health Horizons, (ESWL), L.P., affiliated with the following hospitals: Community Memorial Hospital, Freehold Area Hospital, Helene Fuld Medical Center, Jersey Shore Medical Center, Raritan Bay Medical Center, Riverview Medical Center, Robert Wood Johnson University Hospital, St. Francis Medical Center, St. Peter's Medical Center, Somerset Medical Center.

Trustees' Minutes; UMDNJ Notes; AMNJ Report; New Members; Physicians Seeking Location in New Jersey

Trustees' Minutes January 17, 1988

A meeting of the Board of Trustees was held on January 17, 1988, at the Executive Offices in Lawrenceville. Detailed minutes are on file with the secretary of your county society. A summary of significant actions follows:

Report of the President . . .

1. Medicaid Fees . . . Reported that legislative efforts to achieve appropriate Medicaid increases will be undertaken by the Society.

2. Legislative Committee—Medical Inter-Insurance Exchange of New Jersey . . . Noted that bills dealing with the two basic issues in tort reform, structured payments, and statute of limitations, had not been enacted in the previous session of the Legislature.

3. Task Force on AIDS . . . Noted that the Task Force will be developing a program for presentation at the 1988 Annual Meeting.

4. Senior Citizens Forum . . . Received programs from the third Senior Citizens Forum to be held on April 6, 1988, and noted the keynote address will be delivered by Senator John Kitzhaber, M.D.

5. Executive Committee . . .

a. State Commission of Investigation (SCI) Report on Impaired Physicians Program Update . . . Noted

the Executive Committee received a report from Mr. Maressa to be considered by the Board in Executive Session.

b. Foundation of UMDNJ Request for Funding . . .

Advised that a recommendation regarding a grant will be submitted for action to the Board.

c. Applications for Position of Editor of NEW JERSEY MEDICINE . . .

Noted that a subcommittee has been named to review applications for consideration by the full Executive Committee.

6. Legislation—Bill A-1591 . . . Indicated an interest in pursuing this bill which prohibits licensing by agency action; the bill stipulates that no category of health care provider shall practice or be licensed or certified to practice in New Jersey without statutory authorization.

7. Ad Hoc Committee on Women in Medicine . . .

Noted that special letters were sent to women physicians inviting them to join MSNJ and noted the importance of promoting MSNJ membership at hospital medical staff meetings.

Report of Executive Director . . .

1. MSNJ Paid Membership . . .

Noted that a total of 5,973 members have paid 1988 dues—slightly ahead of paid memberships last year.

2. Special Assessment . . . Noted that 70 percent of dues-paying members have paid the \$100 special assessment to fund the activities of the Council on Public Relations.

3. MSNJ Financial Statements . . . Approved the financial statements for the periods ending December 31, 1987, and January 31, 1988.

4. SCI Report—Licensing Reform Legislation . . . Noted that licensing reform legislation drafted by Judge Herbert J. Stern was presented to Senator Richard J. Codey; the concept is being prepared in bill form.

5. Reinsurance Association Surcharge . . . Decided that the Secretary is to write a letter to Governor Kean, stating the Society's position on the Reinsurance Association surcharge, and requesting his assistance in arriving at an equitable solution to the situation.

6. AIDS Research Program . . . Approved the Society's cosponsorship of the television program on AIDS research, and authorized a contribution of up to \$10,000 to help underwrite the cost of the production.

7. Medicaid . . . Noted that a rec-

ommendation will be submitted to the Board by the Committee on Medicaid concerning the Garden State Managed Health Care Plan.

UMDNJ . . . Noted the following items from Dr. Bergen's report: the discovery by UMDNJ's research team of the first case of another AIDS virus, HIV-2; proposed investments to meet the "Top 25" challenge by Governor Kean; five-year project to reduce smoking through medical education; and construction of a new research facility for the Center for Molecular Medicine and Immunology.

NJ Hospital Association . . . Noted the following items from Mr. Scibetta's report: the Hospital Rate-Setting Commission approval of the Department of Health recommendation to adjust the labor component of the economic factor; a four-point plan to ease the nursing shortage; scholarship program, educational program, management development program, and salary adjustments; medical waste disposal problems; New Jersey Hospital Association AIDS Task Force; pharmacy bill A-2559 containing provisions for certain reporting requirements for hospitals that own retail pharmacies; and phase-out of the Uncompensated Care Trust Fund Act.

Academy of Medicine of NJ . . .

Noted Doctor Richard C. Reynolds, Executive Vice-President of the Robert Wood Johnson Foundation is the winner of the Edward J. Ill Award and Assemblyman Chuck Hardwick is the recipient of the Citizen's Award; and noted a symposium on AIDS to take place on March 16, 1988.

Impaired Physicians . . .

1. Name Change . . . Approved the following recommendation:

That the Impaired Physicians Program be renamed as the Physicians' Health Program, and that the Committee on Impaired Physicians be renamed as the Committee on Physicians' Health.

2. Drug Abuse Insurance for Members of MSNJ and NJAOPS . . . Referred the following recommendation to the Committee on Membership Services for further study:

That a study be undertaken of the health insurance policies endorsed by the Medi-

cal Society of New Jersey and the New Jersey Association of Osteopathic Surgeons and Physicians to evaluate the practicality of adding coverage for drug abuse.

3. Impaired Physician Without License Needs Insurance for Wife . . .

Noted the case of an impaired physician who voluntarily surrendered his license and lost insurance coverage and membership status in MSNJ; he requested consideration of his needs; the matter to be researched further.

Committee on Long-Range Planning and Development . . .

1. Recommendations: Approved the following three recommendations:

That the Society's policy to require documentation of economic need before members are placed in the dues-exempt category be continued.

That the following dues structure be implemented after age 71, and that eligible members be required to submit a formal request to participate in the dues reduction plan:

- Age 71: Member pays full dues
- Age 72: Member pays 75 percent of dues
- Age 73: Member pays 50 percent of dues
- Age 74: Member pays 25 percent of dues
- Age 75: Dues-exempt/emeritus status

That retired physicians and/or out-of-state physicians, who are not members of the Society but wish to subscribe to certain services (Journal, etc.) shall pay a fee-for-service for these services only.

2. Informational Meetings for the General Membership . . . Approved the following recommendation:

That the President of the Medical Society of New Jersey send letters to the county medical societies, inviting the general membership to attend a specific meeting of the Board of Trustees, to participate in an open forum discussion of issues.

3. Education Program at Annual Meeting . . . Approved the following recommendation:

That the Medical Society of New Jersey proceed with the concept of holding scientific sessions at future Annual Meetings, recognizing that the sessions initially may have to be phased in, depending on the availability of required facilities; and that special emphasis be placed on the blending of major socioeconomic issues and scientific programs.

New Business . . .

1. Blue Shield Payment to Medicare Patients . . . Referred to the

Council on Medical Services complaints that participating physicians who do not accept Medicare fee assignment are fined. Blue Shield sends payment directly to the patient, contrary to their contractual agreement.

2. AMA Leadership Conference . . .

Received a report from Dr. Karl Franzoni on the AMA Leadership Conference, noting the following: Representative Dan Rostenkowski indicated a growing realization by the federal government that the task of providing high-tech health care to an aging population has created a resource shortage problem; and Mr. William Roper was castigated for his premature release of hospital mortality figures. Also, noted Dr. Henry Mineur is a candidate for AMA's Council on Constitution and Bylaws and Dr. Michael Bernstein is being recommended for appointment to the Residency Review Committee for internal medicine; and agreed to place a resolution before the AMA proposing a change of location for the AMA Leadership Conference (usually held in midwinter in Chicago).

3. CME Seminar on Psychiatry in the Soviet Union . . . Noted that Dr. Blakey reported the Council on Mental Health had been asked to endorse a CME seminar on psychiatry in the Soviet Union; he was told that the established position of MSNJ is not to approve or endorse education programs—that is the function of the Academy of Medicine of New Jersey.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D.

The eyes of much of the world focused on UMDNJ for two days in January, as researchers at UMDNJ-New Jersey Medical School confirmed the nation's first known case of AIDS caused by the HIV-2 virus.

The fact that the first case wound up at UMDNJ was an accident. The fact that the case was diagnosed correctly was not. The outstanding medical detective work that led to that diagnosis was a direct result of the investment that UMDNJ has made in people and resources in its drive to become one of the premiere health sciences institutions in the country.

The investigative team involved in the discovery was headed by Rajendra Kapila, M.D., and Stanley H.

Weiss, M.D. Dr. Kapila is Director of Infectious Diseases at UMDNJ-University Hospital and is also associate professor of medicine and of preventive medicine and community health at the medical school. Dr. Weiss is a former National Cancer Institute investigator involved in some of the nation's most important AIDS findings of the past few years. He is an assistant professor of medicine and of preventive medicine and community health at the medical school.

The doctors reported that the case involved a visitor from West Africa who was admitted to University Hospital with neurological symptoms. They emphasized that the case appeared to be isolated and that there was no evidence of any potential spread of the new virus to others in this country.

The investigation began when the patient was found to have infections of the central nervous system indicative of AIDS. However, the standard antibody test performed for HIV-1 had ambiguous results. Since the patient came from West Africa, where the HIV-2 virus was originally documented, the physicians contacted the Centers for Disease Control and arranged for further blood testing. The subsequent test results were found by an out-of-state laboratory to be "strongly positive" for HIV-2.

The means of transmission for the virus appear to be similar to HIV-1, which means the same precautions would apply. The physicians are optimistic that surveillance for this virus will be easier than for HIV-1 because the blood test for HIV-2 already is available. Also, they noted that out of more than 20,000 blood samples tested for the virus in this country among individuals at high risk for HIV-1, not one has been confirmed to have HIV-2 antibodies.

Aside from Drs. Kapila and Weiss, the investigative team at New Jersey Medical School included Jennifer Michaels, M.D., of the department of neurosciences; Joseph Lombardo, M.D., and Leroy Sharer, M.D., of the department of pathology; Maria Tayyarah, M.D., of the department of preventive medicine and community health; Joan Leonard, M.D., Anthony Mangia, M.D., Patricia Kloser, M.D., and S. Sathe, M.D., all of the department of medicine; and James Oleske, M.D., and Thomas Denny,

from the division of allergy, immunology, and infectious diseases.

I am proud of the interdisciplinary effort that went into the discovery and understanding of this complicated virus—an effort that reflects well on UMDNJ's continuous drive for excellence. I feel certain that when the epitaph of the AIDS epidemic is finally written, the University of Medicine and Dentistry of New Jersey, already recognized nationally for research into the disease, will figure prominently.

AMNJ Report

Anthony B. Minnefor, M.D.

The Board of Trustees of the Academy of Medicine of New Jersey has named the 1988 recipients of the Awards to be presented at the Annual Awards Dinner on Wednesday, May 25, 1988, at the Chanticleer in Short Hills.

Richard C. Reynolds, M.D., will receive the Edward J. Ill Award "presented annually to that physician of New Jersey who merits recognition by the Academy for distinguished service as a leader in the medical

profession." Recent recipients have included Drs. James Todd, Leon G. Smith, Arthur Krosnick, Alfred Alessi, Stanley Bergen, Palma Formica, and Paul Hirsch. Dr. Reynolds is best known for his many contributions to New Jersey medicine as Dean of UMDNJ-Robert Wood Johnson Medical School and as UMDNJ Senior Vice-President for Academic Affairs. The rapid development of UMDNJ and, in particular, the growth of Robert Wood Johnson Medical School in large part can be attributed to Dr. Reynolds' efforts. He also has found the time to participate in the activities of organized medicine and currently is serving as Vice-President of the Middlesex County Medical Society.

The Academy's Citizen's Award is "presented annually to that citizen or group of citizens of New Jersey who merit recognition by the Academy for distinguished service in the interest of the health and welfare of the community at large." The 1988 Citizen's Award has been granted to Chuck Hardwick. Mr. Hardwick, currently the Speaker of the New Jersey Assembly, has given tirelessly of himself in matters of assuring ap-

propriate health care delivery for all citizens. Included in his many efforts is the sponsorship of malpractice reform legislation.

Another important aspect of our 1988 dinner will be the election of Dr. James S. Todd to Honorary Fellowship. Dr. Todd, who presently is Senior Deputy Executive Vice-President of the American Medical Association, was the recipient of the Edward J. Ill Award in 1980. Dr. Todd will become the sixth individual in the history of the Academy to receive this honor which may be bestowed on any physician or scientist of exceptional eminence.

The Academy is pleased to announce that we have agreed to assume the office management functions for the New Jersey Association of Electromyography and Electrodiagnosis. The organization consists of approximately 120 physician members who either are physiatrists or neurologists. Dr. Melvin Goldberg of Clifton is the current President and Dr. Champa Bid of Saddle Brook is Secretary/Treasurer.

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ALLERGY—Jerry Michael Shier, M.D., 11546 February Cir., Apt. 202, Silver Spring, MD 20904. UMDNJ 1982. Also, clinical immunology. Board eligible. Board certified (PED). Group, partnership, solo. Available July 1988.

ANESTHESIOLOGY—Daniel O'Brien, M.D., 12 Beech Dr., Brunswick, ME 04011. Liege (Belgium) 1975. Board certified. Group, partnership, solo. Available.

Steven H. Ressler, M.D., 424 North Midland Ave., Saddlebrook, NJ 07662. Guadalajara 1982. Board eligible. Group or fee-for-service. Available July 1988.

CARDIOLOGY—Richard Don Diego, M.D., 6020 Danny Kaye, #906, San Antonio, TX 78240. Central Caribbean (Puerto Rico) 1981. Also, internal medicine. Board eligible. Group or partnership. Available July 1988.

Donald G. Rubenstein, M.D., 1037 3rd St., #303, Santa Monica, CA 90403. Louisiana 1980. Board eligible. Group or partnership. Available August 1988.

Govindaraju Subramani, M.D., 4250 N. Marine Dr., Apt. 506, Chicago, IL 60613. Wisconsin 1987. Board eligible. Partnership or group. Available.

ENDOCRINOLOGY—Gerald B. Miele, M.D., 110 Fleet Pl., Mineola, NY 11501. Rush 1983. Also, internal medicine. Board eligible. Partnership, group, solo. Available July 1988.

FAMILY MEDICINE—Roy Berkowitz-Shelton, M.D., 132 Grove Pk., Ft. Dix, NJ 08640. Georgetown 1981. Board certified. Partnership. Available.

Serge I. Kaftal, M.D., 30 South Auten Ave., Somerville, NJ 08876. Lodz (Poland) 1980. Board eligible. Solo, partnership, group. Available November 1988.

Chava Zimmerman, M.D., 127F Amberly Dr., Manalapan, NJ 07726. Wayne State 1978. Board certified. Group or HMO. Available July 1988.

GASTROENTEROLOGY—Anil Agarwal, M.D., 18 Maltese Dr., Fair Lawn, NJ 07410. LLRM Medical (India) 1979. Also, internal medicine. Board eligible. Board certified (IM). Available July 1988.

David Rosenbock, M.D., 5 Riggs Pl., West Orange, NJ 07052. UMDNJ. Board eligible. Board certified (IM). Group, partnership, solo. Available July 1988.

INTERNAL MEDICINE—Anil Agarwal, M.D., 18 Maltese Dr., Fair Lawn, NJ 07410. LLRM Medical 1979. Also, gastroenterology. Board certified. Available July 1988.

Paul R. Axelrad, M.D., 666 Ninth St., Lakewood, NJ 08701. St. George's University 1985. Methodist Hospital. Board eligible. Group or partnership. Available July 1988.

Glenn A. Dubov, M.D., 75-36 Bell Blvd., Apt. 2A, Bayside, NY 11364. Chicago 1983. Board certified. Group or partnership. Available July 1988.

Marc Hanfling, D.O., 26 Glen Lane, Cherry Hill, NJ 08002. New York College 1981. Also, cardiology. Board certified. Board eligible (CARD). Group, partnership, solo. Available.

Peter Kuzmick, D.O., 62 Diamond Ave., Fort Rucker, AL 36362. Kansas City College 1980. Board certified. Group or partnership. Available July 1988.

Gerald B. Miele, M.D., 110 Fleet Pl., Mineola, NY 11501. Rush 1983. Also, endocrinology. Board eligible. Partnership, group, solo. Available July 1988.

Edward C. Phillips, M.D., 24 Walnut St., Summit, NJ 07901. Downstate 1984. Board eligible. Group, partnership, solo. Available July 1988.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Board eligible. Board certified (PED). Also, pediatrics. Group,

partnership, academic. Available October 1988.

NEPHROLOGY—Glenn A. Dubov, M.D., 75-36 Bell Blvd., Bayside, NY 11364. Chicago 1983. Also, internal medicine. Board certified (IM). Group or partnership. Available July 1988.

PEDIATRICS—Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Also, internal medicine. Board certified. Board eligible (IM). Group, partnership, academic.

Linda York-Chance, M.D., 435 East 70th St., New York, NY 10021. Connecticut 1985. Board eligible. Clinic or emergency room. Available July 1988.

PULMONARY—Martin J. Greenberg, M.D., 76 Church St., Montclair, NJ 07042. Ross 1983. Board eligible. Partnership or group. Available July 1988.

SURGERY—James H. Frost, M.D., 655 W. Irving Pk. Rd., Apt. 4306, Chicago, IL 60613. Guadalajara; Mt. Sinai Fifth Pathway 1983. Board eligible. Group or partnership. Available July 1988.

Robert M. O'Brien, M.D., 182 Estates Dr., Piedmont, CA 94611. Vermont 1958. Also, noncardiac thoracic surgery. Board certified. Group, partnership, solo, in southern New Jersey only. Available.

*The University of Pennsylvania School of Medicine is accredited by the Accreditation Council for Continuing Medical Education to sponsor continuing education for physicians. The University of Pennsylvania School of Medicine designates this continuing medical activity for 2 credit hours per session in Category I of the Physician's Recognition Award of the American Medical Association.

The following is a list of continuing medical education courses for the next two months. Contact the sponsoring organization for further information.

CARDIOLOGY

May

- 9 **Cardiac Rehabilitation**
7-8 P.M.—Wallkill Valley General Hospital, Sussex (AMNJ)
- 26 **Anti-Arrhythmic Therapy**
3-4 P.M.—Ancora Psychiatric Hospital, Hammondon (AMNJ)
- 26 **Pathophysiology and Management of Acute Heart Failure**
11 A.M.—St. Joseph's Hospital and Medical Center, Paterson (St. Joseph's Hospital and Medical Center)

June

- 1 **Anti-Arrhythmic Therapy/Clinical Arrhythmia**
10:30-11:30 A.M.—Saint Mary's Hospital, Passaic (AMNJ)
- 1 **Streptokinase and Percutaneous Transluminal Coronary Angioplasty**
10:30-11:30 A.M.—Christ Hospital, Jersey City (AMNJ)
- 1 **Advanced Cardiac Life Support**
- 8 6 P.M.—Freehold Area Hospital, Freehold (Freehold Area Hospital)
- 16 **Ventricular Arrhythmias . . . When To Treat**
11 A.M.—St. Joseph's Hospital and Medical Center, Paterson (St. Joseph's Hospital and Medical Center)

DERMATOLOGY

May

- 10 **Annual Dinner, Dermatological Society of New Jersey**
6:30 P.M.—Chanticleer, Short Hills (Dermatological Society of NJ)
- 18 **Dermatology Conferences**
6-9 P.M.—Rutgers Community Health Plan, 57 U.S. Highway 1, New Brunswick (UMDNJ)

June

- 2 **Common Dermatoses**
2:30-3:30 P.M.—New Lisbon Developmental Center, New Lisbon (AMNJ)

MEDICINE

April

- 18- **HIV in Children**
- 19 Sheraton Meadowlands Hotel, East Rutherford (New Jersey Department of Health)

May

- 2 **Rheumatology Staff Conference**
5:30-7 P.M.—Robert Wood Johnson Medical School, MEB-393, New Brunswick (UMDNJ)
- 4 **Computers in Medicine**
10:30-11:30 A.M.—Christ Hospital, Jersey City (AMNJ)
- 4 **New Approaches to Gastrointestinal Bleeding**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)
- 7 **Endocrine Series**
11:30 A.M.-1 P.M.—VA Medical Center, East Orange (AMNJ)
- 10 **Chronic Pain Management and Issues Related to Iatrogenic Addiction**
12 noon-1 P.M.—Hospital Center at Orange (AMNJ)

11 Medical Grand Rounds

- 18 10 A.M.—St. Mary Hospital, Hoboken (St. Mary Hospital)

11 New Treatments in Cerebrovascular Disease

- 1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (AMNJ)

11 Role of Operative Cholangiography in Biliary Tract Surgery

- 10:30-11:30 A.M.—Saint Mary's Hospital, Passaic (AMNJ)

11 Drug-Induced Lung Disease

- 8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth (Alexian Brothers Hospital)

11 Annual Morris Saffron Lecture

- 10 A.M.-2 P.M.—Medical Society of New Jersey, Lawrenceville (Medical History Society of New Jersey)

12 Potassium Loss

- 12 noon-1 P.M.—Community Memorial Hospital, Toms River (Community Memorial Hospital)

17

The Treatment of Glomerulonephritis

- 4-5 P.M.—Robert Wood Johnson Medical School, MEB, New Brunswick (UMDNJ)

19

Fluid and Electrolyte Imbalance

- 1:30-2:30 P.M.—Vineland Developmental Center and Hospital (AMNJ)

19

Clinical Issues in Human Sexuality

- 5-6:30 P.M.—Somerset Medical Center, Fuld Auditorium, Somerville (Somerset Medical Center)

26

Visiting Professor Program

- 1:30-2:30 P.M.—Saint Barnabas Medical Center, Livingston (Saint Barnabas Medical Center)

30

Caring for the Patient on a Ventilator

- 1:30-2:30 P.M.—Health Maintenance Organization, New Brunswick (Rutgers Community Health Plan)

June

6

Rheumatology Staff Conference

- 5:30-7 P.M.—Robert Wood Johnson Medical School, MEB-393, New Brunswick (UMDNJ)

7

Hirsutism

- 7-8 P.M.—West Hudson Hospital, Kearny (West Hudson Hospital)

8

New Treatments in Cerebrovascular Diseases

- 10:30-11:30 A.M.—Saint Mary's Hospital, Passaic (AMNJ)

8

Medical Grand Rounds

15

- 10 A.M.—St. Mary Hospital,

22

- Hoboken (St. Mary Hospital)

8

Joint Meeting: NJ Society for Gastrointestinal Endoscopy and NJ Gastroenterological Society

- 3 P.M.—The Manor, West Orange (NJ Society of Gastrointestinal Endoscopy and NJ Gastroenterological Society)

14

Myasthenia Gravis

- 12 noon-1 P.M.—Hospital Center at Orange (AMNJ)

15

Proper Use of Endoscopy

- 10:30-11:30 A.M.—Saint Mary's Hospital, Passaic (AMNJ)

16

Entrepreneurial Medicine: Does It Challenge Traditional Medicine?

- 5-6:30 P.M.—Fuld Auditorium, Somerset Medical Center, Somerville (Somerset Medical Center)

17

Infectious Diseases—AIDS, Hepatitis, New Cephalosporins

- 10:30-11:30 A.M.—Woodbridge Developmental Center, Woodbridge (AMNJ)

21

Regional Nephrology Conference Series

- 4-5 P.M.—Robert Wood Johnson Medical School, MEB, New Brunswick (UMDNJ)

June 6-10, 1988
UPDATE YOUR MEDICINE 1988

Association of Practicing Physicians of The New York Hospital and Cornell University Medical College. 33 hours Category 1 credit, (39 if optional workshops taken). A one week review of all subspecialties of internal medicine. 9 major review symposia, 4 lectures, 10 workshops, 2 Meet the Professor luncheons, optional practice workshops in breast/pelvic and male genitoretal examinations. Held at The New York Hospital-Cornell, 1300 York Avenue at 69th Street, New York. Information: Office of CME, 212-472-6119. Dr. Lila A. Wallis is Course Director.

ACUPUNCTURE IN CLINICAL PRACTICE

NY State Boards of Medicine & Dentistry 25-hour accredited seminar & workshop on the latest theories & techniques of manual and electro-acupuncture, TENS & simple non-invasive diagnostic methods (including cardio-vascular & neuromuscular systems & "Bi-Digital O-Ring Test"), applicable toward the 300-hour requirement for acupuncture certification, will be given for licensed clinicians (with or without prior training) the weekends of April 22-24, May 15-17, June 17-19 and December 9-13, 1988 at the Milford Plaza Hotel, 45th St. & 8th Avenue, Manhattan. The 4th International Symposium on Acupuncture & Electro-Therapeutics, with many world leading scientists & clinicians will be held at the Columbia U Sch. of Int. Affairs, NYC, Oct. 13-16, 1988. Co-sponsored by the Int. College of Acupuncture & Electro-Therapeutics; its official journal. *Acupuncture & Electro-Therapeutics, Res., Int. J.* (published by Pergamon Press, indexed in 15 major indexing periodicals: Index Medicus, etc.); Heart Disease Research Foundation; Neuroscience Dept. & NY Pain Ctr., Long Island College Hospital; (SUNY-Brooklyn Health Science Ctr.); Nordic Medical Acupuncture Society; & Schmerz-Therapeutische-Kolloquium (W. Germany); etc. Also eligible for AMA/CME credit, category 1. For info on meetings or submission of papers, contact Y. Omura, MD, ScD, 800 Riverside Drive (8-I), NYC 10032. Tel: (212) 781-6262 or (212) 928-0658, or P. Shinnick, PhD, (212) 941-0870 or (201) 246-8557.

Alzheimer's Disease Update—1988

on
Wednesday, May 18, 1988
9:30 a.m.-4:30 p.m.

at
Somerset Medical Center
Somerville, New Jersey

OVERVIEW

This conference is directed at physicians and other health care providers who wish to expand their knowledge of Alzheimer's Disease and other dementing illness. It will build on the knowledge gained from the previous conferences (ALZHEIMER'S DISEASE UPDATE—1987) by dealing with current information regarding this group of illnesses. However, participants need not have attended the conference in 1987 to profit from the material to be presented. The course faculty represents individuals with first-hand knowledge of the clinical, psychological and ethical issues involved in the diagnosis and management of individuals with dementing syndromes.

OBJECTIVE

*Participants will be able to integrate new developments in geriatrics with their current knowledge to manage their elderly patients more effectively.

FRANK C. SNOPE, M.D.
 Symposium Chairman
 Professor, Department of Family Medicine
 Director, Geriatric Programs at
 UMDNJ-Robert Wood Johnson Medical School
 Senior Family Physician, COPSA

YOCON[®] YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon[®] is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon[®] 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

From Hippocrates to Virchow, Reflections on Human Disease; The Ischemic Leg; Manual for Eye Examination and Diagnosis; 1987 Year Book of Family Practice; Office Gynecology; Primary Care of the Newborn

From Hippocrates to Virchow, Reflections on Human Disease

James M. Byers, M.D. Chicago, IL, ASCF Press, 1987.

The term "Renaissance man" has been bandied around so loosely in recent years that it has lost much of its significance, yet the author of the present work seems almost worthy of the designation.

A pathologist who avows interest in archaeology, nature photography, and exhibition horsemanship, Dr. Byers still has found time to write a book which has the laudable purpose of luring the average physician back to a reappraisal of his long neglected heritage. In order to accomplish this, Dr. Byers has selected from the writings of the great thinkers pertinent passages relating to medical practice and thought, which he then proceeds to comment upon and show their relevance to our times. Thus, in discussing the *Prognosis* of Hippocrates (as did Maurus of Salerno), he points out the importance of explaining candidly to the patient and his family the dangers inherent in the disease in order to promote trust between

the sick man and his doctor and avoid later lawsuits. Among the other luminaries whose thoughts are examined are Plato, Aristotle, Thucydides, Avicenna, and Maimonides among the older men; Chaucer, Aquinas, Montaigne, and Harvey among the more recent.

Despite its rather outré oblong appearance, this is a most stimulating book which should give pleasure to all thinking physicians. It is well illustrated, but has two minor faults: it has been indexed to a ludicrous excess and the editor apparently never learned the value of the abbreviation *Ibid*.

Morris H. Saffron, M.D.

The Ischemic Leg

Richard F. Kempczinski, M.D. Chicago, IL, Year Book Medical Publishers, Inc., 1985. Pp. 587.

This comprehensive volume is written in a unified fashion despite the participation of 55 recognized and experienced contributors. Amazingly, little repetition is noted and the multiauthors styles blend comfortably lending themselves to easy reading. Illustrations are clear and compliment the topics appropriately. The bold typeface minimizes eye strain.

The book is separated into five sections beginning with the historical developments of lower extremity revascularization, the natural history of atherosclerotic ischemia as well as other causes of ischemia, and the impact of diabetes and related disorders. An elaborate presentation of noninvasive and invasive diagnostic modalities follows. A section on nonoperative management precedes the largest section of the book which details the various surgical approaches, their indications, and short- and long-term results. The chapters describing "on the shelf" grafts as opposed to autogenous tissue serve as excellent guidelines to current graft utilization. The final section focuses on amputations, indications and preferences, technical details, and rehabilitation. The chapter on amputations as an alternate form of treatment for restoring a bipedal gait deserves special attention.

There are few omissions that warrant flagging. Compliments are forthcoming to the editor and contributors for their thoroughness. Supplemental references were perti-

nent and well chosen. *The Ischemic Leg*, an excellent and current compilation, is recommended to surgeons at all levels of vascular training and experience. It rightfully deserves a place in your library.

Joseph Alpert, M.D.

Manual for Eye Examination and Diagnosis

Mark W. Leitman, M.D. Oradell, NJ, Medical Economics, 1988.

Dr. Leitman has written a well-organized manual of ophthalmic examination and diagnosis. This manual is aimed at the medical student, and is a very useful adjunct for the medical or surgical intern desiring a concise introduction to the ophthalmic examination.

The manual is organized and presented in the basic order of the ophthalmic examination. Aside from the few drawings in the back of the book, all of the illustrations are black-and-white drawings. For the most part, the drawings are quite well done and serve to point out the condition being explained. The text could benefit from some photographs in color, though this would increase the cost of the book significantly.

The text begins with the medical history, listing and explaining common chief complaints. Dr. Leitman importantly draws attention to the relationships of ophthalmic to systemic diseases. Visual acuity is explained in the next chapter with a very brief introduction to optics as related to the ametropias. There also is a short section of this chapter mentioning the corrections of the ametropias, including spectacles, contact lenses, and radial keratotomy. This section is a little too brief and would be better if expanded slightly.

The chapter on neuro-ophthalmology nicely reviews the nerve innervations, visual pathways, pupillary abnormalities, and other common neuro-ophthalmic disorders. There also is a brief explanation of visual field defects.

There is a chapter devoted to external abnormalities with drawings of each explained condition. Treatment also is mentioned in a very few words. There is a three-page chapter on the orbit with a diagram of the frontal view of the orbit with simple

anatomical labeling. Exophthalmos and enophthalmos also are explained in this chapter.

The chapter on slit lamp examination covers the anterior segment with adequate drawings and explanations. This is followed by a chapter on the lens with a brief explanation of cataract surgery and intraocular lenses. Dr. Leitman also has devoted a chapter to glaucoma, superficially covering its diagnosis and treatment.

The last chapter covers the retina and its disorders covering topics in a little more detail than that seen in other chapters. There are several drawings in color illustrating diabetic retinopathy and other common retinal lesions.

Overall, this manual covers the ophthalmic examination in adequate detail for the medical student and even first-year resident outside the field of ophthalmology. It is well written and easy to read for all those interested in eye care.

William H. Constad, M.D.

1987 Year Book of Family Practice

Robert E. Rakel, M.D., (ed). Chicago, IL, Year Book Medical Publishers, Inc., 1987. Pp. 612.

The Year Book of Family Practice is one publication in a rather widely known series of "Year Books." The major difference between this text and others is in the scope of material covered. By the editor's own admission, over 679 journals were reviewed with 400 articles gleaned from 121 of these magazines. This is a rather monumental undertaking and reflects the divergence found in clinical family practice. However, by its very scope, the possibility of significant articles "falling through the cracks" is very real. Be that as it may, the *1987 Year Book of Family Practice* does address a need. In one publication, it provides a broad range of scientifically based articles containing information that should be considered germane to the practice of the contemporary family physician. The articles are of consistent scholarly value and obviously have been selected with some care. They provide a wealth of information about a variety of subjects, and as far as possible for a textbook, represent the state of the art relative to the

scientific and clinical underpinnings of the discipline of family practice.

The only major criticism I would have of the selection of articles is that perhaps they are too academic in their orientation. The clinician, desiring purely practical and day-to-day clinical information, may labor with some of the more esoteric information provided in this collection of papers.

Joseph A. Lieberman, III, M.D.

Office Gynecology. Third Edition

Robert H. Glass (ed). Baltimore, MD, Williams & Wilkins, 1988. Pp. 362. (\$47.95)

Almost every gynecologic problem that might arise in an office or clinic is thoroughly covered in 19 chapters by a host of experts. It would seem likely that a book published in three editions should contain everything you ever wanted to know about office gynecology but were afraid to ask.

Yet, this text, contains too much, e.g. too much space devoted to etiology which belongs more appropriately in a textbook for medical students. There is speculative material that should be aired more appropriately at a panel discussion, e.g. the alleged advantage of new triphasic oral contraceptives over low-dose monophasics. There is dated material that should have been eliminated, e.g. progestins in early pregnancy discredited because of unproved efficacy and fear of litigation over fetal anomalies. The old Papanicolaou classification should have been replaced by the modern nomenclature which is consistent with histology. One contributor encourages private adoptions which might lead to a license suspension in New Jersey for a participating physician. No contributor addresses adequately the problem of the unnecessary high percentage of false negative cytology which is undermining confidence in the best method for detection of early cancer by physicians today.

Most of the material in each chapter is excellent, but errors of commission and omission prevent an unqualified endorsement of this book.

Jerome Abrams, M.D.

Primary Care of the Newborn

Ronald W. Coen, M.D., and Herbert Koffler, M.D. Waltham, MA, Little, Brown & Company, 1987.

Primary Care of the Newborn is a softcover text that focuses on the care and management of the normal newborn. As the authors indicate in the book's preface, more than 90 percent of newborn infants have an uncomplicated perinatal course, yet the major focus of the neonatal literature in the past 20 years has been on the compromised infant. This text attempts to serve as a much needed reference to guide physicians in private practice who care for normal newborns.

The initial three chapters of the book deal with the assessment of pregnancy and labor, the initial physical examination of the newborn infant, and nursery procedures.

The middle three chapters focus on common problems in the first 24 hours of life, special problems in the first 24 hours of life, and assessment and followup beyond the first 24 hours of life. The book discussed these problems on a thorough organ system basis. These three chapters also contain many tables that present valuable information such as the differential diagnosis of respiratory distress, the differential diagnosis of cardiac problems, the time of first defecation and urination, and the evaluation of persistent vomiting.

The next two chapters deal with nutrition and discharge planning and preparation. The last chapter discussed the organization and operation of a level I nursery.

Finally, there is an excellent appendix containing information from normal laboratory values in newborns, to drug dosages, to information on the preparation of formulas.

In general, I feel *Primary Care of the Newborn* is good; it is clearly and concisely written. The text is an excellent reference, especially for medical students, housestaff, and physicians entering private practice for the first time. It also should serve as a good review and reference for those physicians who have been in practice and are well experienced.

Gerald M. Raymond, M.D.

***Drs. Born; Francis; Harris;
Kahn; Kim; Klinger;
Laurenceau; Lucent;
Manrodt; Matyjasik;
McCloskey; Milliser;
Nuraltay; Olmstead; Simon;
Ruppert; Weisman***

Dr. Joseph Born

Family physician and ear, nose, and throat specialist Joseph Born, M.D., 71, retired in Florida since 1982, died on April 11, 1987, after years of practice in Lincoln Park. A native of Paterson, Dr. Born received his medical degree from the University of Arkansas School of Medicine, Little Rock, in 1942. He served on the staffs of Chilton Hospital, Pompton Plains; Barnert Hospital, Paterson; and Riverside Hospital, Boonton. Dr. Born was a member of our Passaic County component and of the American Medical Association.

Dr. Alfred M. Francis

Union City orthopedic surgeon Alfred Martin Francis, M.D., died on December 21, 1987, at the age of 62. Born in Clearfield, Pennsylvania, Dr. Francis was graduated from the University of Louisville School of Medicine, Kentucky, in 1946. Two years after serving as captain in the United States Air Force, Dr. Francis began a Union City private medical practice in 1957, and maintained this practice until his recent passing. He was affiliated with Christ Hospital, Jersey City, as chief of orthopedic surgery; Jersey City Medical Center, as coordinator of orthopedic services from 1968-1973; and Palisades General Hospital, North Bergen. Dr. Francis also was professor at UMDNJ-New Jersey Medical

School, Newark. A Diplomate in orthopedic surgery, Dr. Francis was a member of our Hudson County component.

Dr. Edwin A. Harris

Retired in Easton, Maryland, Moorestown physician Edwin Anderson Harris, M.D., 90, died on December 14, 1987. Born in Dover, Delaware, Dr. Harris received his medical degree from Jefferson Medical College, Philadelphia, in 1920. As well as maintaining a private practice, Dr. Harris was a health officer for Stratford, and school physician for Stratford, Lindenwold, Somerdale, and Gibbsboro. During the 1930s and 1940s, he served as a medical missionary in the Belgian Congo and Nigeria, West Africa. A Fellow of the American Academy for Cerebral Palsy, Dr. Harris was a member of our Burlington County component and of the American Medical Association. In 1970, he was a recipient of the Medical Society of New Jersey's Golden Merit Award, recognizing his 50 years as a physician.

Dr. Leo Kahn

Retired internal medicine specialist Leo Kahn, M.D., died on November 9, 1987, at the age of 80. Born in New York City, Dr. Kahn attended Jefferson Medical College of Philadelphia, where he received his medical degree in 1931. For many years he maintained a private practice in Atlantic City. Dr. Kahn was a member of our Atlantic County component and of the American Medical Association. He received MSNJ's Golden Merit Award in 1981.

Dr. Jae Nam Kim

Diagnostic radiologist Jae Nam Kim, M.D., of Ridgewood, died on January 2, 1988, at the age of 58. A native of Korea, Dr. Kim received his medical degree from Seoul University School of Medicine, Korea, in 1953, and his Ph.D. in anatomy from the University of Minnesota, Minneapolis, in 1959. He served on the staff of Pascack Valley Hospital, Westwood, and was physician for Sharlin Radiology Associates, Hackensack. A Diplomate in diagnostic radiology and in nuclear medicine, Dr. Kim was a member of our Bergen County component and of the American Medical Association.

Dr. Joseph Klinger

Internal medicine specialist Joseph Klinger, M.D., died on January 23, 1988, at the age of 55. A native of New York City, Dr. Klinger received his medical degree from New York University School of Medicine, New York, in 1957. He became affiliated with Alexian Brothers Hospital, Elizabeth General Medical Center, and St. Elizabeth Hospital, all in Elizabeth. Dr. Klinger was a member of our Union County component and of the American Medical Association.

Dr. Victor Laurenceau

Anesthesiologist Victor Laurenceau, M.D., died on October 5, 1987, at the age of 55. Born in Haiti, Dr. Laurenceau received his medical degree from the University of Haiti, in 1955. He became affiliated with North Hudson Hospital, Weehawken, and Bayonne Hospital. A Diplomate in anesthesiology, Dr. Laurenceau was a member of our Hudson County component and of the American Medical Association.

Dr. S. Bell Lucent

Retired family physician S. Bell Lucent, M.D., died on January 23, 1988, at the age of 91. Born in Malta, Great Britain, Dr. Lucent received his medical degree from Cornell University Medical College, New York, in 1921. He lived in Little Falls for 69 years, where he opened a private practice. A Fellow of the American Geriatric Society, Dr. Lucent was a member of our Passaic County component and of the American Medical Association. He was a staff member of Wayne General Hospital. A United States Army veteran, Dr. Lucent served during World War I. In 1971, he was a recipient of MSNJ's Golden Merit Award, honoring his 50 years of medical practice.

Dr. Kurt Manrodt

Cofounder of Chilton Memorial Hospital, Pompton Plains, Kurt Manrodt, M.D., 71, died on January 12, 1988. A Brooklyn, New York native, Dr. Manrodt received his medical degree in 1943 from the University of Pennsylvania School of Medicine, Philadelphia. He opened a Pompton Plains private practice in 1946, after serving as captain in the United States Army medical corps during World War II. Dr. Manrodt

maintained this practice for 40 years. With the intention of providing medical care to the Pompton Plains area, Dr. Manrodt and his uncle, Dr. Forest Spencer Chilton, built Chilton Hospital in 1954. From 1954 to 1986, Dr. Manrodt was a member of the Hospital's Board of Trustees, and became the first chairman of the pediatrics department, president of the medical dental staff, and medical director of sports medicine. Before Dr. Manrodt's retirement in 1986, a pediatric wing was dedicated in his name. Active in his community of Pequannock Township, Dr. Manrodt was school physician, medical director of civil defense, member of the Juvenile Conference Committee, and medical inspector for the Board of Health. For many years of service, Dr. Manrodt was honored in a 1981 Township of Pequannock proclamation. A Fellow of the American Academy of Family Practice, Dr. Manrodt was a member of our Passaic County component and of the American Medical Association.

Dr. Frank M. Matyjasik

Trenton family physician Frank Matthew Matyjasik, M.D., 74, died on January 13, 1988. Born in Trenton, and a lifetime area resident, Dr. Matyjasik received his medical degree from Hahnemann Medical College and Hospital, Philadelphia, Pennsylvania, in 1939. He maintained a family medical practice in Trenton for 45 years, retiring in 1986. Dr. Matyjasik was affiliated with Helene Fuld Medical Center and Hamilton Hospital. He was a member of our Mercer County component and of the AMA.

Dr. John F. McCloskey

John Francis McCloskey, M.D., Director of Pulmonary Medicine at St. Francis Medical Center, Trenton, died on December 13, 1987, at the age of 56. Born in Easton, Pennsylvania, Dr. McCloskey received his medical degree from Temple University School of Medicine, Philadelphia, in 1955. A Diplomate in both pediatric allergy, and allergy and immunology, Dr. McCloskey was a Fellow of the American College of Chest Physicians. He was a member of our Mercer County component and of the American Medical Association. Dr. McCloskey served with the

United States Air Force from 1955 to 1964, emerging with the rank of captain.

Dr. Estelle T. Milliser

Retired general practitioner Estelle Thompson Milliser, M.D., died on January 4, 1988, at the age of 79. A Newark native, Dr. Milliser received her medical degree at the Chicago College of Medicine and Surgery, Illinois, in 1936. She maintained a private practice in Westfield, and became affiliated with Overlook Hospital, Summit. A school physician for South Orange, and later, Westfield, Dr. Milliser was a member of our Union County component and of the American Medical Association. She was a 1986 recipient of MSNJ's Golden Merit Award.

Dr. Ilhan S. Nuraltay

South River internal medicine specialist Ilhan S. Nuraltay, M.D., died on December 19, 1987, at the age of 62. A native of Silistra, Dr. Nuraltay attended the Faculty of Medicine, Bucharest, Romania, where he received his medical degree in 1950. He served on the staffs of UMDNJ-Robert Wood Johnson Medical School and St. Peter's Medical Center, both in New Brunswick, and was assistant professor in research at New York Medical College, New York City. Dr. Nuraltay was a member of our Middlesex County component and of the American Medical Association.

Dr. Edwin V. Olmstead

Retired pathologist Edwin V. Olmstead, M.D., died in Atlanta, Georgia, on December 21, 1987, at the age of 77. He had been retired in Marietta, Georgia, since 1980. Born in South Worcester, New York, Dr. Olmstead received his medical degree from the University of Pennsylvania School of Medicine, Philadelphia, in 1936. He was director of pathology at Hunterdon Medical Center, Flemington, from 1953 to 1975. A Diplomate in clinical pathology, and pathologic anatomy, Dr. Olmstead was a Fellow of the College of American Pathologists, and was a member of our Hunterdon County component and of the American Medical Association. He was a veteran of World War II. In 1986, Dr. Olmstead received MSNJ's Golden Merit Award.

Dr. Ludwig L. Simon

Ludwig Lothar Simon, M.D., retired in Ft. Lauderdale, Florida, following an active medical practice, died at the age of 86, in August 1987. Born in Germany, Dr. Simon was graduated from the University of Cincinnati College of Medicine, Ohio, in 1927. He was on the staffs of Newark Beth Israel Medical Center, Newark, and Clara Maass Medical Center, Belleville. A member of our Essex County component, and of the American Medical Association, Dr. Simon was a Fellow of the American College of Angiology and of the American Geriatric Society. He served during World War II in the United States Air Force, as a major. In 1977, he received MSNJ's Golden Merit Award, for 50 years of medical practice.

Dr. Ralph E. Ruppert

Ralph Edward Ruppert, M.D., of Absecon, died on January 25, 1988, at the age of 65. A Sunnyside, Washington native, Dr. Ruppert received his medical degree from Hahnemann Medical College and Hospital, Philadelphia, in 1948. A Fellow of the American Academy of Family Practice, Dr. Ruppert was school physician for the Pilgrim Academy in Egg Harbor City, and was clinical preceptor for UMDNJ-New Jersey Medical School. Maintaining a practice in Absecon, he was a 40-year area resident. Dr. Ruppert was a United States Army medical corps veteran of the Korean Conflict.

Dr. Stephen L. Weisman

Dermatologist Stephen Lee Weisman, M.D., died on January 13, 1988, at the age of 77. Born in New York City, Dr. Weisman received his medical degree from Rush Medical College, Chicago, Illinois, in 1936. He became affiliated with Wayne General Hospital, eventually serving as chief emeritus of dermatology and allergy. Dr. Weisman maintained private practices in Paterson and Passaic. During World War II, Dr. Weisman was a captain in the United States Army medical corps at the general hospital, Calcutta, India. He was dermatology consultant at Veterans Hospital, Lyons, and was founder and administrator of the Hilltop House and Nursing Home. In 1986, Dr. Weisman received MSNJ's Golden Merit Award.

AUTHOR INFORMATION

New Jersey Medicine is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in New Jersey Medicine is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

First hundreds...

Then thousands...

Soon more than a million.

Soon more than a million insulin users will be taking Humulin.

And no wonder. Humulin is identical to the insulin produced by the human pancreas—except that it is made by rDNA technology.

Humulin is not derived from animal pancreases. So it contains none of the animal-source pancreatic impurities that may contribute to insulin allergies or immunogenicity.

The clinical significance of insulin antibodies in the complications of diabetes is uncertain at this time. However, high antibody titers have been shown to decrease the small amounts of endogenous insulin secretion some insulin users still have. The lower immunogenicity of Humulin has been shown to result in lower insulin antibody titers; thus, Humulin may help to prolong endogenous insulin production in some patients.

Any change of insulin should be made cautiously and only under medical supervision. Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente®, etc), species/source (beef, pork, beef-pork, or human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

DIET...EXERCISE...

Humulin® 
human insulin
(recombinant DNA origin)

For your insulin-using patients

DOCTORS **WANTED**

FOR STEERING COMMITTEE

The United States Medical Advisory Association wants doctors as part of a steering committee to help coordinate product evaluation for major pharmaceutical companies and medical suppliers.

To inquire about this rewarding and lucrative opportunity call:

In PA: 215-828-4676

Outside PA: 800-223-7076

UNITED STATES
MEDICAL ADVISORY
ASSOCIATION

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor:

MAJOR CLAUDIA GIBSON
609-667-8190

ARMY RESERVE.
BE ALL YOU CAN BE.

ORTHOPAEDIC SURGEON

A highly successful multi-specialty group with three orthopaedic surgeons is searching for a fourth orthopaedist. All types of general orthopaedic problems are treated; however, due to the significant volume of back injury cases we encounter, an interest in spinal injuries is important. The income potential for an ambitious orthopaedic surgeon is excellent. The practice is located in a growing Mid-Atlantic state only twenty miles from a beach resort area. Baltimore and Philadelphia are also within close proximity. If you are interested, please submit your curriculum vitae and references to Mr. J. Stokes, P.O. Box 19, Milford, DE 19963.

Health Care Personnel Consulting, Inc.

a division of The Health Care Group

specializes in valuation and sales. We have practices currently available in the following specialty areas:

**DENTAL, DERMATOLOGY, FAMILY PRACTICE,
INTERNAL MEDICINE, OPHTHALMOLOGY**

**YOUR ROCHE REPRESENTATIVE
WOULD LIKE YOU TO HAVE
SOMETHING THAT WILL ...**

- ... improve patient satisfaction with office visits
- ... improve patient compliance with your instructions
- ... reduce follow-up calls to clarify instructions

The new Roche product books

- Offer a supplement to, not a substitute for, patient contact
- Support your specific instructions to the patient
- Provide a long-term reinforcement of your oral counseling

Because you are the primary source of medical information for your patients, we invite you to look over the Roche Product Booklets shown below and ask your Roche representative for a complimentary supply of those applicable to your practice.

Medicines that matter from people who care

COMMITTED TO EXCELLENCE

The logo is a large, stylized orange flower-like shape. At the top center is a black circle containing a white hexagon with the word "ROCHE" in black capital letters. Below this, the words "PRESIDENT'S ACHIEVEMENT AWARD" are written in bold, black, sans-serif capital letters.

We're putting lives back together.

As a physician you've probably seen it. A family's struggle against alcohol or drugs. A man or woman afraid to ask for help in dealing with depression. A young girl hiding an eating disorder behind a smiling face or popular personality.

At the Carrier Foundation, we work with physicians in treating troubled adolescents and adults. Unlike most general hospitals, all our resources are dedicated to this mission. And have been for more than seventy-five years.

Recognized by all major insurance companies, Carrier is a private, non-profit psychiatric hospital providing both inpatient and outpatient programs. Some of Carrier's specialized programs include: addiction recovery service, adolescent program, affective disorders program, behavioral therapy, eating disorders program, family therapy, geriatric program and women's program.

For more information, call the Carrier Foundation at 1-800-223-0207. The Carrier Foundation. We're putting lives back together.

The appearance of advertising in *NEW JERSEY MEDICINE* is not a Medical Society of New Jersey guarantee or endorsement of the product or service, or the claims made for the product or service, by the advertiser. When the Medical Society of New Jersey has endorsed a product or program, that will be expressly noted.

Before prescribing, see complete prescribing information in SK&F LAB CO. literature or PDR. The following is a brief summary.

Contraindications: There are no known contraindications to the use of 'Tagamet'.

Precautions: While a weak antiandrogenic effect has been demonstrated in animals, 'Tagamet' has been shown to have no effect on spermatogenesis, sperm count, motility, morphology or in vitro fertilizing capacity in humans.

In a 24-month toxicity study in rats at dose levels approximately 9 to 56 times the recommended human dose, benign Leydig cell tumors were seen. These were common in both the treated and control groups, and the incidence became significantly higher only in the aged rats receiving 'Tagamet'.

Rare instances of cardiac arrhythmias and hypotension have been reported following the rapid administration of 'Tagamet' HCl (brand of cimetidine hydrochloride) injection by intravenous bolus.

Symptomatic response to 'Tagamet' therapy does not preclude the presence of a gastric malignancy. There have been rare reports of transient healing of gastric ulcers despite subsequently documented malignancy.

Reversible confusional states have been reported on occasion, predominantly in severely ill patients.

'Tagamet' has been reported to reduce the hepatic metabolism of warfarin-type anticoagulants, phenytoin, propranolol, chlorthalidoxime, diazepam, lidocaine, theophylline and metronidazole. Clinically significant effects have been reported with the warfarin anticoagulants; therefore, close monitoring of prothrombin time is recommended, and adjustment of the anticoagulant dose may be necessary when 'Tagamet' is administered concomitantly. Interaction with phenytoin, lidocaine and theophylline has also been reported to produce adverse clinical effects.

However, a crossover study in healthy subjects receiving either 'Tagamet' 300 mg. q.i.d. or 800 mg. h.s. concomitantly with a 300 mg. b.i.d. dosage of theophylline (Theo-Dur®, Key Pharmaceuticals, Inc.),

demonstrated less alteration in steady-state theophylline peak serum levels with the 800 mg. h.s. regimen, particularly in subjects aged 54 years and older. Data beyond ten days are not available. (Note: All patients receiving theophylline should be monitored appropriately, regardless of concomitant drug therapy.)

Lack of experience to date precludes recommending 'Tagamet' for use in pregnant patients, women of childbearing potential, nursing mothers or children under 16 unless anticipated benefits outweigh potential risks; generally, nursing should not be undertaken in patients taking the drug since cimetidine is secreted in human milk.

Adverse Reactions: Diarrhea, dizziness, somnolence, headache, rash. Reversible arthralgia, myalgia and exacerbation of joint symptoms in patients with preexisting arthritis have been reported. Reversible confusional states (e.g., mental confusion, agitation, psychosis, depression, anxiety, hallucinations, disorientation), predominantly in severely ill patients, have been reported. Gynecomastia and reversible impotence in patients with pathological hypersecretory disorders receiving 'Tagamet', particularly in high doses, for at least 12 months, have been reported. Reversible alopecia has been reported very rarely. Decreased white blood cell counts in 'Tagamet'-treated patients (approximately 1 per 100,000 patients), including agranulocytosis (approximately 3 per million patients), have been reported, including a few reports of recurrence on rechallenge. Most of these reports were in patients who had serious concomitant illnesses and received drugs and/or treatment known to produce neutropenia. Thrombocytopenia (approximately 3 per million patients) and a few cases of aplastic anemia have also been reported. Increased serum transaminase and creatinine, as well as rare cases of fever, interstitial nephritis, urinary retention, pancreatitis and allergic reactions, including hypersensitivity vasculitis, have been reported. Reversible adverse hepatic effects, cholestatic or mixed cholestatic-hepatocellular in nature, have been reported rarely. Because of the predominance of cholestatic features, severe parenchymal injury is considered highly un-

likely. A single case of biopsy-proven periportal hepatic fibrosis in a patient receiving 'Tagamet' has been reported.

How Supplied: Tablets: 200 mg. tablets in bottles of 100; 300 mg. tablets in bottles of 100 and Single Unit Packages of 100 (intended for institutional use only); 400 mg. tablets in bottles of 60 and Single Unit Packages of 100 (intended for institutional use only), and 800 mg. Tiltab® tablets in bottles of 30 and Single Unit Packages of 100 (intended for institutional use only).

Liquid: 300 mg./5 ml., in 8 fl. oz. (237 ml.) amber glass bottles and in single-dose units (300 mg./5 ml.), in packages of 10 (intended for institutional use only).

Injection:

Vials: 300 mg./2 ml. in single-dose vials, in packages of 10 and 30, and in 8 ml. multiple-dose vials, in packages of 10 and 25.

Prefilled Syringes: 300 mg./2 ml. in single-dose prefilled disposable syringes.

Plastic Containers: 300 mg. in 50 ml. of 0.9% Sodium Chloride in single-dose plastic containers, in packages of 4 units. No preservative has been added.

ADD-Vantage® Vials: 300 mg./2 ml. in single-dose, ADD-Vantage® Vials, in packages of 25.

Exposure of the premixed product to excessive heat should be avoided. It is recommended the product be stored at controlled room temperature. Brief exposure up to 40°C does not adversely affect the premixed product.

'Tagamet' HCl (brand of cimetidine hydrochloride) Injection premixed in single-dose plastic containers is manufactured for SK&F Lab Co. by Travenol Laboratories, Inc., Deerfield, IL 60015.

* ADD-Vantage® is a trademark of Abbott Laboratories.

PromptCare

"We care . . . about your health"

Attention Physicians and Hospital Executives:

ARE YOU READY TO ASSUME ECONOMIC CONTROL OVER YOUR MEDICAL PRACTICE? ARE YOU READY TO JOINT VENTURE WITH YOUR MEDICAL STAFF/HOSPITAL?

ARE YOU READY TO ASSUME CLINICAL LEADERSHIP FOR YOUR PATIENTS DISCHARGED "QUICKER & SICKER" WHO REQUIRE AIDS THERAPY, OXYGEN OR DME?

ARE YOU READY TO JOIN 900 NEW JERSEY PHYSICIANS IN GROUP PURCHASING MEDICAL AND OFFICE SUPPLIES?

PromptCare has helped nine groups of physicians and seven hospitals establish their own Home Health Care Equipment and Medical Office Supply companies. No more just signing forms for outsiders without input. No more profits to outsiders for necessary office expenses.

If you and your peers are interested, please contact Mr. Michael Garippa, President, at 355-0200. As few as 15 physicians can create a new group.

The PromptCare Companies—The largest collective physician effort in NJ business: Summit, Rahway, Elizabeth, Corvas, Plainfield, Ocean, Atlantic, Hudson County and Raritan.

There's never been a better time for her..

and PREMARIN[®]

**Proven benefits beyond relief
of vasomotor symptoms**

**No other estrogen proven
effective for osteoporosis**

Only conjugated estrogens tablets have established efficacy in both osteoporosis¹ and vasomotor symptoms* at 0.625 mg/day. No other estrogen, oral or transdermal, has established clinical evidence or minimum effective dose in both indications.

No estrogen proven safer

PREMARIN is the most extensively tested estrogen, with an unsurpassed record of long-term safety.

And clinical evidence shows a significantly reduced risk of endometrial hyperplasia when cycled with a progestin.²

PREMARIN[®]
(conjugated estrogens tablets)

Most trusted for more reasons

*PREMARIN is indicated for moderate-to-severe vasomotor symptoms.

Please see following page for brief summary
of prescribing information.

For moderate-to-severe
vasomotor symptoms and
for osteoporosis

PREMARIN® (conjugated estrogens tablets)

The appearance of these tablets is a trademark of Ayerst Laboratories.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION AND PATIENT INFORMATION, SEE PACKAGE CIRCULARS)

PREMARIN® Brand of conjugated estrogens tablets, USP
PREMARIN® Brand of conjugated estrogens Vaginal Cream, in a nonliquefying base

1. ESTROGENS HAVE BEEN REPORTED TO INCREASE THE RISK OF ENDOMETRIAL CARCINOMA.

Three independent, case-controlled studies have reported an increased risk of endometrial cancer in postmenopausal women exposed to exogenous estrogens for more than one year. This risk was independent of the other known risk factors for endometrial cancer. These studies are further supported by the finding that incidence rates of endometrial cancer have increased sharply since 1969 in eight different areas of the United States with population-based cancer reporting systems, an increase which may be related to the rapidly expanding use of estrogens during the last decade. The three case-controlled studies reported that the risk of endometrial cancer in estrogen users was about 4.5 to 13.9 times greater than in nonusers. The risk appears to depend on both duration of treatment and on estrogen dose. In view of these findings, when estrogens are used for the treatment of menopausal symptoms, the lowest dose that will control symptoms should be utilized and medication should be discontinued as soon as possible. When prolonged treatment is medically indicated, the patient should be reassessed on at least a semi-annual basis to determine the need for continued therapy. Although the evidence must be considered preliminary, one study suggests that cyclic administration of low doses of estrogen may carry less risk than continuous administration; it therefore appears prudent to utilize such a regimen. Close clinical surveillance of all women taking estrogens is important. In all cases of undiagnosed persistent or recurring abnormal vaginal bleeding, adequate diagnostic measures should be undertaken to rule out malignancy. There is no evidence at present that "natural" estrogens are more or less hazardous than "synthetic" estrogens at equi-estrogenic doses.

2. ESTROGENS SHOULD NOT BE USED DURING PREGNANCY.

The use of female sex hormones, both estrogens and progestogens, during early pregnancy may seriously damage the offspring. It has been shown that females exposed in utero to diethylstilbestrol, a nonsteroidal estrogen, have an increased risk of developing, in later life, a form of vaginal or cervical cancer that is ordinarily extremely rare. This risk has been estimated as not greater than 4 per 1,000 exposures. Furthermore, a high percentage of such exposed women (from 30% to 90%) have been found to have vaginal adenosis, epithelial changes of the vagina and cervix. Although these changes are histologically benign, it is not known whether they are precursors of malignancy. Although similar data are not available with the use of other estrogens, it cannot be presumed they would not induce similar changes. Several reports suggest an association between intrauterine exposure to female sex hormones and congenital anomalies, including congenital heart defects and limb-reduction defects. One case-controlled study estimated a 4.7-fold increased risk of limb-reduction defects in infants exposed in utero to sex hormones (oral contraceptives, hormone withdrawal tests for pregnancy, or attempted treatment for threatened abortion). Some of these exposures were very short and involved only a few days of treatment. The data suggest that the risk of limb-reduction defects in exposed fetuses is somewhat less than 1 per 1,000. In the past, female sex hormones have been used during pregnancy in an attempt to treat threatened or habitual abortion. There is considerable evidence that estrogens are ineffective for these indications, and there is no evidence from well-controlled studies that progestogens are effective for these uses. If PREMARIN is used during pregnancy, or if the patient becomes pregnant while taking this drug, she should be apprised of the potential risks to the fetus, and the advisability of pregnancy continuation.

DESCRIPTION: PREMARIN (conjugated estrogens, USP) contains a mixture of estrogens, obtained exclusively from natural sources, blended to represent the average composition of material derived from pregnant mares' urine. It contains estrone, equilin, and 17 α -dihydroequilin, together with smaller amounts of 17 α -estradiol, equilenin, and 17 α -dihydroequilenin as salts of their sulfate esters. Tablets are available in 0.3 mg, 0.625 mg, 0.9 mg, 1.25 mg, and 2.5 mg strengths of conjugated estrogens. Cream is available as 0.625 mg conjugated estrogens per gram.

INDICATIONS AND USAGE: PREMARIN (conjugated estrogens tablets, USP): Moderate-to-severe vasomotor symptoms associated with the menopause. (There is no evidence that estrogens are effective for nervous symptoms or depression without associated vasomotor symptoms and they should not be used to treat such conditions.) Osteoporosis (abnormally low bone mass). Atrophic vaginitis. Kraurosis vulvae. Female castration. PREMARIN (conjugated estrogens) Vaginal Cream is indicated in the treatment of atrophic vaginitis and kraurosis vulvae.

PREMARIN HAS NOT BEEN SHOWN TO BE EFFECTIVE FOR ANY PURPOSE DURING PREGNANCY AND ITS USE MAY CAUSE SEVERE HARM TO THE FETUS (SEE BOXED WARNING).

Concomitant Progestin Use: The lowest effective dose appropriate for the specific indication should be utilized. Studies of the addition of a progestin for 7 or more days of a cycle of estrogen administration have reported a lowered incidence of endometrial hyperplasia. Morphological and biochemical studies of the endometrium suggest that 10 to 13 days of progestin are needed to provide maximal maturation of the endometrium and to eliminate any hyperplastic changes. Whether this will provide protection from endometrial carcinoma has not been clearly established. There are possible additional risks which may be associated with the inclusion of progestin in estrogen replacement regimens. (See PRECAUTIONS.) The choice of progestin and dosage may be important; product labeling should be reviewed to minimize possible adverse effects.

CONTRAINDICATIONS: Estrogens should not be used in women (or men) with any of the following conditions: 1. Known or suspected cancer of the breast except in appropriately selected patients being treated for metastatic disease. 2. Known or suspected estrogen-dependent neoplasia. 3. Known or suspected pregnancy (see Boxed Warning). 4. Undiagnosed abnormal genital bleeding. 5. Active thrombophlebitis or thromboembolic disorders. 6. A past history of thrombophlebitis, thrombosis, or thromboembolic disorders associated with previous estrogen use (except when used in treatment of breast or prostatic malignancy).

WARNINGS: Estrogens have been reported to increase the risk of endometrial carcinoma (see Boxed Warning). However, a recent large, case-controlled study indicated no increase in risk of breast cancer in postmenopausal women. A recent study has reported a 2- to 3-fold increase in the risk of surgically confirmed gallbladder disease in women receiving postmenopausal estrogens.

Adverse effects of oral contraceptives may be expected at the larger doses of estrogen used to treat prostatic or breast cancer or postpartum breast engorgement; it has been shown that there is an increased risk of thrombosis in men receiving estrogens for prostatic cancer and women for postpartum breast engorgement. Users of oral contraceptives have an increased risk of diseases, such as thrombophlebitis, pulmonary embolism, stroke, and myocardial infarction. Cases of retinal thrombosis, mesenteric thrombosis, and optic neuritis have been reported in oral contraceptive users. An increased risk of postsurgery thromboembolic complications has also been reported in users of oral contraceptives. If feasible, estrogen should be discontinued at least 4 weeks before surgery of the type associated with an increased risk of thromboembolism, or during periods of prolonged immobilization. Estrogens should not be used in persons with active thrombophlebitis, thromboembolic disorders, or in persons with a history of such disorders in association with estrogen use. They should be used with caution in patients with cerebral vascular or coronary artery disease. Large doses (5 mg conjugated estrogens per day), comparable to those used to treat cancer of the prostate and breast, have been shown to increase the risk of nonfatal myocardial infarction, pulmonary embolism, and thrombophlebitis. When doses of this size are used, any of the thromboembolic and thrombotic adverse effects should be considered a clear risk.

For atrophic vaginitis

PREMARIN® (conjugated estrogens)

Vaginal
Cream

0.625 mg/g

Benign hepatic adenomas should be considered in estrogen users having abdominal pain and tenderness, abdominal mass, or hypovolemic shock. Hepatocellular carcinoma has been reported in women taking estrogen-containing oral contraceptives. Increased blood pressure may occur with use of estrogens in the menopause and blood pressure should be monitored with estrogen use. A worsening of glucose tolerance has been observed in patients on estrogen-containing oral contraceptives. For this reason, diabetic patients should be carefully observed. Estrogens may lead to severe hypercalcemia in patients with breast cancer and bone metastases.

PRECAUTIONS: Physical examination and a complete medical and family history should be taken prior to the initiation of any estrogen therapy with special reference to blood pressure, breasts, abdomen, and pelvic organs, and should include a Papanicolaou smear. As a general rule, estrogen should not be prescribed for longer than one year without another physical examination being performed. Conditions influenced by fluid retention, such as asthma, epilepsy, migraine, and cardiac or renal dysfunction, require careful observation. Certain patients may develop manifestations of excessive estrogenic stimulation, such as abnormal or excessive uterine bleeding, mastodynia, etc. Prolonged administration of unopposed estrogen therapy has been reported to increase the risk of endometrial hyperplasia in some patients. Oral contraceptives appear to be associated with an increased incidence of mental depression. Patients with a history of depression should be carefully observed. Pre-existing uterine leiomyomata may increase in size during estrogen use. The pathologist should be advised of estrogen therapy when relevant specimens are submitted. If jaundice develops in any patient receiving estrogen, the medication should be discontinued while the cause is investigated. Estrogens should be used with care in patients with impaired liver function, renal insufficiency, metabolic bone diseases associated with hypercalcemia, or in young patients in whom bone growth is not yet complete. If concomitant progestin therapy is used, potential risks may include adverse effects on carbohydrate and lipid metabolism.

The following changes may be expected with larger doses of estrogen:

- Increased sulfolobomphthalene retention.
- Increased prothrombin and factors VII, VIII, IX, and X; decreased antithrombin 3; increased norepinephrine-induced platelet aggregability.
- Increased thyroid binding globulin (TBG) leading to increased circulating total thyroid hormone, as measured by PBI, T_4 by column, or T_4 by radioimmunoassay. Free T_3 resin uptake is decreased, reflecting the elevated TBG; free T_4 concentration is unaltered.
- Impaired glucose tolerance.
- Decreased pregnanediol excretion.
- Reduced response to metyrapone test.
- Reduced serum folate concentration.
- Increased serum triglyceride and phospholipid concentration.

As a general principle, the administration of any drug to nursing mothers should be done only when clearly necessary since many drugs are excreted in human milk.

Long-term, continuous administration of natural and synthetic estrogens in certain animal species increases the frequency of carcinomas of the breast, cervix, vagina, and liver. However, in a recent, large case-controlled study of postmenopausal women there was no increase in risk of breast cancer with use of conjugated estrogens.

ADVERSE REACTIONS: The following have been reported with estrogenic therapy, including oral contraceptives: breakthrough bleeding, spotting, change in menstrual flow, dysmenorrhea; premenstrual-like syndrome, amenorrhea during and after treatment; increase in size of uterine fibromyomata; vaginal candidiasis, change in cervical erosion and in degree of cervical secretion; cystitis-like syndrome; tenderness, enlargement, secretion (of breasts); nausea, vomiting, abdominal cramps, bloating; cholestatic jaundice; chloasma or melasma which may persist when drug is discontinued; erythema multiforme; erythema nodosum, hemorrhagic eruption; loss of scalp hair, hirsutism; steepening of corneal curvature; intolerance to contact lenses; headache, migraine, dizziness, mental depression, chorea; increase or decrease in weight; reduced carbohydrate tolerance; aggravation of porphyria; edema; changes in libido.

ACUTE OVERDOSAGE: May cause nausea, and withdrawal bleeding may occur in females.

DOSEAGE AND ADMINISTRATION:

PREMARIN® Brand of conjugated estrogens tablets, USP

1. *Given cyclically for short-term use only.* For treatment of moderate-to-severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with the menopause (0.3 mg to 1.25 mg or more daily). The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible. Administration should be cyclic (eg, three weeks on and one week off). Attempts to discontinue or taper medication should be made at three- to six-month intervals.

2. *Given cyclically.* Osteoporosis: Female castration. Osteoporosis —0.625 mg daily. Administration should be cyclic (eg, three weeks on and one week off). Female castration —1.25 mg daily, cyclically. Adjust upward or downward according to response of the patient. For maintenance, adjust dosage to lowest level that will provide effective control.

Patients with an intact uterus should be monitored for signs of endometrial cancer and appropriate measures taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

PREMARIN® Brand of conjugated estrogens Vaginal Cream

Given cyclically for short-term use only. For treatment of atrophic vaginitis or kraurosis vulvae.

The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible.

Administration should be cyclic (eg, three weeks on and one week off).

Attempts to discontinue or taper medication should be made at three- to six-month intervals.

Usual dosage range: 2 g to 4 g daily, intravaginally, depending on the severity of the condition.

Treated patients with an intact uterus should be monitored closely for signs of endometrial cancer and appropriate diagnostic measures should be taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

THE MEDICAL SOCIETY OF NEW JERSEY

VOLUME 54

NJ LIBRARY FOR THE BLIND & HANDICAPPED Available Services

The best kept secret in New Jersey is the New Jersey Library for the Blind and Handicapped. The staff at the Library has been serving visually impaired and handicapped residents of New Jersey since 1968.

When people develop a visual or physical problem they feel they no longer can continue the activities they enjoyed before the onset of their illness. The physician often is the first person they contact. When patients decide to "get on" with their life, they can take advantage of help that is available to them because their physician has armed them with information.

Any physician interested in having information about the library should contact, Mrs. Christine Lisiecki, New Jersey Library for the Blind and Handicapped, 2300 Stuyvesant Avenue, Trenton, NJ 08618.

NJ DEPARTMENT OF HUMAN SERVICES New and Proposed Rules

The Division of Medical Assistance and Health Services has submitted a proposal concerning administrative charges and service fees which appeared in the March 7, 1988, issue of the *New Jersey Register* at 20 N.J.R. 518(a). The proposal prohibits any Medicaid provider from paying an administrative charge or service fee for the privilege of doing business with another provider. There is one exception to the prohibition. An administrative charge may be allowed for the collection of a copayment (on behalf of pharmacies) from PAAD beneficiaries.

The Division of Medical Assistance and Health Services has submitted a proposed new rule which appeared in the March 7, 1988, issue of the *New Jersey Register* at 20 N.J.R. 519(a). The rule concerns HAAAD

(Hearing Aid Assistance for the Aged and Disabled).

The HAAAD program is completely state funded.

The income eligibility standards are the same as PAAD (Pharmaceutical Assistance for the Aged and Disabled). Individuals can qualify if their income is \$13,650 or less; married persons can qualify if their income is \$16,750 or less. Those persons who are eligible for HAAAD may receive up to \$100 towards the cost of a hearing aid.

The Division of Medical Assistance and Health Services has submitted an emergency rule and concurrent proposal to extend the optionally Categorically Needy Medicaid coverage to the aged, blind, or disabled. The program is known in New Jersey as JerseyCare. A copy of the rule appeared in the March 7, 1988, issue of the *New Jersey Register*.

NEW JERSEY MEDICINE Journalism Award

NEW JERSEY MEDICINE received First Prize in the Annual Medical Journalism Competition, sponsored by Sandoz Pharmaceuticals. Craig D. Burrell, M.D., vice-president of Sandoz Pharmaceuticals stated, "The awards are a reflection of the increasingly high level of design and writing in many health professional publications." The Sandoz awards recognize the unique importance of state and local professional journals and are part of a year-round project to improve journalism techniques among small-circulation, specialized health publications.

FINI

"Happiness is not a matter of good fortune or worldly possessions. It is a mental attitude. It comes from appreciating what we have, instead of being miserable about what we don't have."

CLARK MARTIN*

Courtesy Catches On; Medicaid Movement; Medical Waste: Trouble Ahead

"COURTESY" CATCHES ON

Senior Medical Courtesy, medicine's common sense answer to forced Medicare, is working well and growing throughout the state. More than 3,000 physicians have volunteered to participate in the Courtesy program, accepting Medicare assignment for the treating of 1,200 senior citizens.

A survey taken last month shows county medical societies in 14 of the state's 21 counties have implemented the Courtesy program; 3 counties plan to begin by the end of this month, and 2 more counties are working toward a late summer/early fall startup. This would leave 2 counties, Cumberland and Salem, without the program in place.

The growth of the Courtesy program is both gratifying and politically significant.

The Courtesy program became one of the Society's major weapons in our legislative battle last year against A-2511, the forced Medicare bill. The program gives substance to medicine's assurances that seniors who need medical care will receive it, regardless of their means, from New Jersey's physician community.

Aside from the favorable media attention it has attracted, the Courtesy program continues to represent a more realistic, better conceived alternative to Medicare assignment bills currently pending in the Legislature as A-2305 (Karcher) and S-1649 (Orechio).

Most county societies today report they are using PAAD criteria for determining eligibility for the courtesy program. This sets annual income limits at \$13,650 for single persons and \$16,750 for a married couple.

What makes the Courtesy program superior to other programs is its flexibility. All counties report they look beyond PAAD eligibility to accept applicants whose medical needs consume an excessive amount of available income.

MEDICAID MOVEMENT?

By the end of May, MSNJ should have a firm idea of whether physicians can expect a meaningful change in the state's Medicaid program.

Because provider fees haven't been increased since the early 1970s, the program is dangerously close to not complying with a federal rule that "payments must be sufficient to enlist enough providers so that services under the plan are available to recipients at least to the extent that these services are available to the general population."

In the proposed fiscal 1989 budget now undergoing action in the Legislature, Governor Kean offered a two-way plan to bolster Medicaid. It calls for increased provider fees for office visits as well as the formation of a Medicaid HMO, the Garden State Health Plan.

Unsure whether Medicaid recipients would want to participate in the HMO to any significant extent, the Society's Medicaid Committee has urged that provider fees be raised to levels which will help assure that physicians who treat the poor won't go bankrupt themselves.

In a number of meetings with the Department of Human Services, the Committee has recommended that reimbursement for a routine office visit be raised from the current \$7 to \$14, or the equivalent of 55 percent of the market value of such service, and that proportional increases be made for specialty care. (Pennsylvania last month increased to \$18 its reimbursement for a routine office visit.)

We appear to be making progress, although nothing will be certain until Governor Kean signs the budget on June 30. By then, the Society hopes to report to its members that the Medicaid burden created by years of neglect has become considerably lighter.

MEDICAL WASTE: TROUBLE AHEAD

Looking for ways to prevent ocean and beach pollution, the Legislature has introduced a number of bills which would prohibit sludge dumping, improve storm water and sewage facilities, and beef up the marine police.

One of the bills, A-2853 (Villane), would create a new system for the collection and disposal of medical waste.

If enacted in its current form, the bill would require facilities and private physicians, regardless of office size, to separate refuse into "general medical waste" and "special medical waste." In the first category are items which today are called "trash," such as letters, newspapers, magazines, and boxes. Classified as "special medical waste" would be microbiological culture media, pathology specimens, blood products, and body fluids at least 20 cc in volume.

The legislation would require a physician to: register with the Department of Environmental Protection as a "generator" of waste; identify the name of the trash service ("transporter") which collects the generator's special and general medical waste; and package and distinctively identify trash with the name and address of the generator on the outside of the package.

This potentially expensive new way to handle routine trash could shock New Jersey's physician community. The Society is actively working on the bill.

*Mr. Martin is MSNJ's legislative consultant.

THE POWER TO PREVENT SUBSTITUTIONS FOR THE ONLY ZERO-ORDER ORAL THEOPHYLLINE IS RIGHT IN YOUR HANDS.

☐ Label
Refill _____ times PRN NR

☒ DO NOT SUBSTITUTE

☐ SUBSTITUTION PERMISSIBLE

THEO-DUR[®]
(theophylline anhydrous) Sustained
Action
Tablets

**There's no substitute
for success.**

Please see following page for brief summary of prescribing information.

THEO-DUR®

THEOPHYLLINE (Anhydrous)

Sustained Action Tablets

INDICATIONS: THEO-DUR is indicated for relief and/or prevention of symptoms of asthma and for reversible bronchospasm associated with chronic bronchitis and emphysema.

CONTRAINDICATIONS: THEO-DUR is contraindicated in individuals who have shown hypersensitivity to theophylline or any of the tablet components.

WARNINGS: Status asthmaticus should be considered a medical emergency and is defined as that degree of bronchospasm which is not rapidly responsive to usual doses of conventional bronchodilators. Optimal therapy for such patients frequently requires both additional medication, parenterally administered, and close monitoring, preferably in an intensive care setting.

Although increasing the dose of theophylline may bring about relief, such treatment may be associated with toxicity. The likelihood of such toxicity developing increases significantly when the serum theophylline concentration exceeds 20 mcg/ml. Therefore, determination of serum theophylline levels is recommended to assure maximal benefit without excessive risk.

Serum levels above 20 mcg/ml are rarely found after appropriate administration of recommended doses. However, in individuals in whom theophylline plasma clearance is reduced for any reason, even conventional doses may result in increased serum levels and potential toxicity. Reduced theophylline clearance has been documented in the following readily identifiable groups: 1) patients with impaired renal or liver function; 2) patients over 55 years of age, particularly males and those with chronic lung disease; 3) those with cardiac failure from any cause; 4) neonates; and 5) those patients taking certain drugs (macrolide antibiotics and cimetidine). Decreased clearance of theophylline may be associated with either influenza immunization or active infection with influenza.

Reduction of dosage and laboratory monitoring is especially appropriate in the above individuals. Less serious signs of theophylline toxicity (i.e. nausea and restlessness) may occur frequently when initiating therapy, but are usually transient, when such signs are persistent during maintenance therapy, they are often associated with serum concentrations above 20 mcg/ml. Unfortunately, however, serious side effects such as ventricular arrhythmias, convulsions or even death may appear as the first sign of toxicity without any previous warning. Stated differently: serious toxicity is not reliably preceded by less severe side effects.

Many patients who require theophylline may exhibit tachycardia due to their underlying disease process so that the cause/effect relationship to elevated serum theophylline concentrations may not be appreciated.

Theophylline products may cause dysrhythmia and/or worsen pre-existing arrhythmias and any significant change in rate and/or rhythm warrants monitoring and further investigation.

The occurrence of arrhythmias and sudden death (with histological evidence of necrosis of the myocardium) has been recorded in laboratory animals (minipigs, rodents and dogs) when theophylline and beta agonists were administered concomitantly, although not when either was administered alone. The significance of these findings when applied to human usage is currently unknown.

PRECAUTIONS: THEO-DUR TABLETS SHOULD NOT BE CHEWED OR CRUSHED.

General: Theophylline half-life is shorter in smokers than in non-smokers. Therefore, smokers may require larger or more frequent doses. Morphine and curare should be used with caution in patients with airway obstruction as they may suppress respiration and stimulate histamine release. Alternative drugs should be used when possible. Theophylline should not be administered concurrently with other xanthine medications. Use with caution in patients with severe cardiac disease, severe hypoxemia, hypertension, hyperthyroidism, acute myocardial injury, cor pulmonale, congestive heart failure, liver disease, in the elderly (especially males) and in neonates. In particular, great caution should be used in giving theophylline to patients with congestive heart failure. Frequently, such patients have markedly prolonged theophylline serum levels with theophylline persisting in serum for long periods following discontinuation of the drug. Individuals who are rapid metabolizers of theophylline, such as the young, smokers, and some non-smoking adults, may not be suitable candidates for once-daily dosing. These individuals will generally need to be dosed at 12 hour or sometimes 8 hour intervals. Such patients may exhibit symptoms of bronchospasm near the end of a dosing interval, or may have wider peak-to-trough differences than desired.

Use theophylline cautiously in patients with history of peptic ulcer. Theophylline may occasionally act as a local irritant to the G.I. tract although gastrointestinal symptoms are more commonly centrally mediated and associated with serum drug concentrations over 20 mcg/ml.

Information for Patients: The physician should reinforce the importance of taking only the prescribed dose and time interval between doses. THEO-DUR tablets should not be chewed or crushed. When dosing THEO-DUR on a once daily (q24h) basis, tablets should be taken whole and not split. As with any controlled-release theophylline product, the patient should alert the physician if symptoms occur repeatedly, especially near the end of the dosing interval.

DRUG INTERACTIONS: Drug-Drug: Toxic synergism with epinephrine has been documented and may occur with some other sympathomimetic bronchodilators. In addition, the following drug interactions have been demonstrated:

Drug	Effect
Theophylline with lithium carbonate	Increased excretion of lithium carbonate
Theophylline with propranolol	Antagonism of propranolol effect
Theophylline with cimetidine	Increased theophylline blood levels
Theophylline with troleandomycin, erythromycin	Increased theophylline blood levels

Drug-Food: THEO-DUR 100 mg Sustained Action Tablets have not been adequately studied to determine whether their bioavailability is altered when given with food. Available data suggest that drug administration at the time of food ingestion may influence the absorption characteristics of theophylline controlled-release products resulting in serum values different from those found after administration in the fasting state.

A drug-food effect, if any, would likely have its greatest clinical significance when high theophylline serum levels are being maintained and/or when large single doses (greater than 13 mg/kg or 900 mg) of a controlled-release theophylline product are given.

THEO-DUR (200, 300, and 450 mg) Sustained Action Tablets: The rate and extent of absorption of theophylline from THEO-DUR 200 mg, 300 mg, and 450 mg tablets when administered fasting or immediately after a moderately high fat content breakfast is similar.

Drug-Laboratory Test Interactions: When plasma levels of theophylline are measured by spectrophotometric methods, coffee, tea, cola beverages, chocolate, and acetaminophen contribute falsely high values.

Carcinogenesis, Mutagenesis, and Impairment of Fertility: Long-term animal studies have not been performed to evaluate the carcinogenic potential, mutagenic potential, or the effect on fertility of xanthine compounds.

Pregnancy: Category C—Animal reproduction studies have not been conducted with theophylline. It is not known whether theophylline can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Xanthines should be given to a pregnant woman only if clearly needed.

Nursing Mothers: It has been reported that theophylline distributes readily into breast milk and may cause adverse effects in the infant. Caution must be used if prescribing xanthine to a mother who is nursing, taking into account the risk/benefit of this therapy.

Pediatric Use: Safety and effectiveness of THEO-DUR administered:

- 1 Every 24 hours in children under 12 years of age, have not been established.
- 2 Every 12 hours in children under 6 years of age, have not been established.

ADVERSE REACTIONS: The most consistent adverse reactions are usually due to overdose and are:

- 1 **Gastrointestinal:** nausea, vomiting, epigastric pain, hematemesis, diarrhea
- 2 **Central nervous system:** headaches, irritability, restlessness, insomnia, reflex hyperexcitability, muscle twitching, clonic and tonic generalized convulsions.
- 3 **Cardiovascular:** palpitation, tachycardia, extrasystoles, flushing, hypotension, circulatory failure, ventricular arrhythmias
- 4 **Respiratory:** tachypnea
- 5 **Renal:** albuminuria, increased excretion of renal tubular and red blood cells, potentiation of diuresis.
- 6 **Other:** rash, hyperglycemia and inappropriate ADH syndrome.

OVERDOSSAGE: Management: If potential oral overdose is established and seizure has not occurred:

- A Induce vomiting
 - B Administer a cathartic (this is particularly important if sustained-release preparations have been taken)
 - C Administer activated charcoal
- If patient is having a seizure:
- A Establish an airway
 - B Administer oxygen
 - C Treat the seizure with intravenous diazepam, 0.1 to 0.3 mg/kg up to 10 mg.
 - D Monitor vital signs, maintain blood pressure and provide adequate hydration.

Post Seizure Coma:

- A Maintain airway and oxygenation
- B If a result of oral medication, follow above recommendations to prevent absorption of the drug, but intubation and lavage will have to be performed instead of inducing emesis, and the cathartic and charcoal will need to be introduced via a large bore gastric lavage tube
- C Continue to provide full supportive care and adequate hydration while waiting for drug to be metabolized. In general, the drug is metabolized sufficiently rapid so as not to warrant consideration of dialysis, however, if serum levels exceed 50 mcg/ml charcoal hemoperfusion may be indicated.

CAUTION: Federal law prohibits dispensing without prescription. For full prescribing information, see package insert.

Malpractice Crises

***Stress Boosts Malpractice Risk;
Existing JUAs in Trouble; California
Compromise Could Rekindle Desire
To Seek Huge Awards***

STRESS BOOSTS MALPRACTICE RISK

Cutting job stress and departmental discord can slash the incidence of malpractice, suggest researchers who studied 56 midwestern hospitals.

St. Paul Insurance Companies analysts found stress a strong predictor of malpractice, John Jones, the firm's chief industrial psychologist, reported at an AMA conference on impaired health professionals. Departments with the highest stress levels accounted for 80 percent of malpractice occurrences.

Stress-management programs targeted to those departments reduced malpractice claims from an average of 1.64 per hospital in 1985 to 0.41 in 1986, the analysts found.

If stressful events in employees' lives or conflicts within the organization interfere with the ability to concentrate on work, people make more mistakes, Jones said. Though substance abuse is "almost always tied" to impaired teams, it aggravates rather than causes malpractice situations.

Impaired teams are even more predictive of malpractice claims than are impaired individuals, he reported. "It's not Mary or Bob who are impaired and doing all the damage. It is a shared value system within a dysfunctional work unit. Departments use one or two individuals' impairment as a crutch, but when we study the situation, [we find] a poorly managed, low-morale team."

Jones described an "organizational climate of malpractice" that includes four problem areas:

- Lack of support from management, coworkers, and technology.
- Too small a staff, with employees who are overworked and under seemingly unbearable deadline pressure.

- Counterproductivity, stemming from substance abuse, theft, rule breaking, or disregard for treatment plans.
- Chronic deep emotional stress manifesting as apathy and fatigue.

In the controlled study, the St. Paul Insurance Companies team surveyed every hospital employee and then compiled each department's total stress and satisfaction levels and compared them with national norms. They provided stress-management training for hospital administrators and managers and then compared the malpractice claims occurrences for the years before and after stress-reduction programs were instituted.

"The survey allowed us to zero in on high-risk departments," Jones said. "In a hospital with 40 departments, I could tell the administrators which three they absolutely had to get to work on" and give "hints about what was going on." Problem locations were "idiosyncratic to institutions" and not most common in high-risk areas such as emergency or intensive care units.

In two-day training sessions, the team taught managers "how to manage troubled employees, lower stressors, and excessive deadline pressure, and build teamwork and a more caring attitude toward patients," said Bruce Barge, who's an industrial and organizational psychologist for the insurance company.

AMA senior deputy vice-president, James Todd lauded the attempt to "help hospitals and physicians learn to diminish and deal with stress" and predicted that soon "we'll be talking about stress-impaired physicians as we now talk about the chemically impaired." But he cautioned against placing too much credibility on a single year's statistics.

St. Paul Insurance Companies now are studying "various assessment and education strategies to help physicians see their own risk factors," Barge said. "Lots of things put physicians at risk for negligence, including emotional problems and senility. The spectrum of impairment is wider than just chemical and substance abuse. We aim to develop a variety of tools to help physicians understand whether they stand on a path that might lead to impairment. We want to get to them before it becomes a problem.

Physicians are among those least likely to seek counseling, because they do not know where to go and are not socialized to think it's acceptable, says clinical physiologist Cynthia D. Scott, a consultant who works with the insurance company's human factors institute. She has developed a "map" that plots stress and coping mechanisms. It is being pilot tested at several centers. In one study, psychiatric residents who recognized their stress patterns by means of the map were able to decrease stress by 74 percent, she said. (*Medical World News*, November 9, 1987)

EXISTING JUAs IN TROUBLE

Five of the ten existing state joint underwriting associations (JUAs) established in the 1970s are estimated to have insufficient funds to cover existing

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department, and Director of Special Projects, respectively.

Scale for Plaintiff Attorney Contingency Fees

Under MICRA reform legislation

40% of first \$50,000 =	\$20,000
33⅓% of next 50,000 =	16,666
25% of next 100,000 =	<u>25,000</u>

Fee on \$200,000 recovery =	\$61,666
10% of any amount over \$200,000	

Under new fee schedule

40% of first \$50,000 =	\$ 20,000
33⅓% of next 50,000 =	16,666
25% of next 500,000 =	<u>125,000</u>

Fee on \$600,000 recovery =	\$161,666
15% of any amount over \$600,000	

Examples of Change in Fee	Under MICRA	New Fee	Percent Increase
\$ 150,000 recovery	\$ 49,166	\$ 49,166	No Change
\$ 200,000 recovery	\$ 61,666	\$ 61,666	No Change
\$ 300,000 recovery	\$ 71,666	\$ 86,666	20.9%
\$ 500,000 recovery	\$ 91,666	\$136,666	49.1%
\$ 750,000 recovery	\$116,666	\$184,666	58.3%
\$1,000,000 recovery	\$141,666	\$221,666	56.5%
\$2,000,000 recovery	\$241,666	\$371,666	53.8%
\$3,000,000 recovery	\$341,666	\$521,666	52.7%

claim liabilities, according to an Alliance of American Insurers report. The JUAs were created and in some cases, funded by state governments during the malpractice crisis of the 1970s, so that medical liability coverage could be written in these areas. Half of the JUAs—South Carolina, New York, New Hampshire, Rhode Island, and Massachusetts—now report shortfalls, ranging from approximately \$4 million in South Carolina to more than \$182 million in Massachusetts.

The reason for the shortfalls, according to Roger K. Kenney, Alliance research manager and author of the report, is because "claims liabilities are accruing at a faster rate than funds are coming in." Kenney commented on the negative impact of the JUA deficiencies. "Unfortunately, additional funds for the financially deficient JUAs will have to come from somewhere, whether it's the insurance industry, health care providers, or policyholders," he stated.

The other five JUAs, Florida, Kansas, Pennsylvania, Texas, and Wisconsin, are expected to meet claim liability payout demands if investment yields are maintained and current reserves are adequate. This forecast may be overly optimistic, however, given the volatility of the economy and the unprecedented increase in number and size of medical malpractice claims.

The report may be obtained from the Alliance of American Insurers, 1501 Woodfield Road, Suite 400 West, Schaumburg, IL 60173. Requests should be directed to Roger K. Kenney and specify the Alliance report entitled, *Financial Condition of Medical Malpractice JUAs*. (*Professional Liability Update*, November 1987)

CALIFORNIA COMPROMISE COULD REKINDLE DESIRE TO SEEK HUGE AWARDS

The ink was barely dry on the "cease-fire" agreement on tort reform worked out between California physicians, a business coalition, and trial lawyers, and encapsulated in a bill slammed through the Assembly in its closing hours when it became clear to some that the "deal" may not be such a good deal after all.

The agreement, which came in the wake of frantic last-minute negotiations in the California Assembly last September, preserves California's Medical Injury

Compensation Reform Act (MICRA) and sets a five-year moratorium on legislative or other efforts to make any changes in it. But the deal also incorporates some adjustments in fees payable to plaintiffs' attorneys.

After analyzing the impact of the changes in the contingency fee scale, the Medical Insurance Exchange of California (MIEC) says the "adjustments" are not so minor after all. The fee increases range from 0 percent for recoveries up to \$200,000, 58.3 percent for a \$750,000 recovery, 56.5 percent for a \$1 million recovery, 53.8 percent for a \$2 million recovery, to 52.7 percent for a \$3 million recovery.

"The plaintiff attorneys have succeeded in reinstating the jumbo jackpot fee which existed in 1975 (before passage of MICRA) and which is the engine that drove the growth of tort law excesses of the past 30 years," Bill Scheuber, MIEC president, told *Medical Liability Monitor*.

First reports of the legislative deal were that some "slight adjustments" had been made in the MICRA provision that sets a sliding scale for attorneys' contingency fees, with the percentage to the lawyer increasing from 10 to 15 percent for awards over \$600,000. MIEC's analysis suggests that the stakes are driven even higher as the award escalates.

There is fear that the new fee schedule again will motivate attorneys to withhold settlement, to concoct bad faith and punitive damage allegations, and new and "imaginative" causes of action, Scheuber warned.

"It also does nothing to improve injured party access to legal help in case of small damages, and preserves the inequity of large pay for little work in cases of large damages and clear liability," he said. "With relaxed limits, we fear the abuses will return."

Scheuber said one plaintiff attorney summed up his pleasure by saying "with this raise in pay, we'll get back in business."

Scheuber also said some are wondering how many cracks will appear in the five-year moratorium. Already the trial bar has said it is not happy with the compromise and defense attorneys also are restive about the plan. Consumers may be next to complain. (*Medical Liability Monitor*, November 25, 1987, Vol. 12, Number 11)

Ulcer therapy that won't yield, even to smoking

YIELD

What do you do for duodenal ulcer patients who should stop smoking, but won't? Both cimetidine¹ and ranitidine² have been shown less effective in smokers than nonsmokers.

Choose CARAFATE® (sucralfate/Marion). Two recent studies show Carafate to be as effective in smokers as nonsmokers.^{3,4} A difference further illustrated in a 283-patient study comparing sucralfate to cimetidine⁵:

Ulcer healing rates:
(at four weeks of therapy)⁵

Sucralfate:

All patients 79.4%

Smokers 81.6%*

Cimetidine:

All patients 76.3%

Smokers 62.5%

*Significantly greater than cimetidine smoker group ($P < .05$).

Carafate has a unique, nonsystemic mode of action that enhances the body's own ulcer healing ability and protects the damaged mucosa from further injury.

When your ulcer patient is a smoker, prescribe the ulcer medication that won't go up in smoke: safe, nonsystemic Carafate.

Nothing works like

CARAFATE®

CARAFATE[®] (sucralfate) Tablets

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE

There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Paks of 100 (NDC 0088-1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other.

From the Beginning

Dr. Palma Formica visits a patient in the intensive care unit.

Topics of great interest come and go over time; in today's world, the position of women has become the source of scholarly searching and intense contemplation. As women gain one height after another in medicine, a view of the problems their predecessors faced and the ways they solved them is instructive. The inauguration of Palma Formica, MD, as the first woman president of the oldest medical society in the United States, provides the impetus for the examination of this topic.

To set the scene, Dr. Regina Morantz-Sanchez uses her 1988 Morris Saffron Lecture for a picture of women and medicine in the late 19th and early 20th centuries. Dr. Estelle Brodman narrows the field to New Jersey in her demographics on women physicians throughout the past century. Drs. Suzanne Widrow and Christine Haycock describe the founding of the New Jersey component of the American Medical Women's Association and the physicians who labored in the work of legitimization, congeniality, and social services. Laurie A. Barrood interviews Dr. Formica on the eve of her inauguration and Stan Godlewski presents a photo essay of Dr. Formica. Dr. Elizabeth Alger and Ms. Barrood study women physicians in education. Barbara Smith Irwin provides information on state sources for further study of a topic which affects all recipients of health care in New Jersey.

New Jersey has had a goodly share of outstanding physicians, most of whom charted new courses by breaking down the barriers against women. A series of articles on "First Ladies" follows: Dr. Eva Brodtkin, the first woman dermatologist by Dr. Morris Saffron; Dr. Jeanette Munro, the first woman pediatrician from her unpublished autobiography; Dr. Rita S. Finkler, the first woman endocrinologist by Dr. Sylvia Becker; Dr. Lena Edwards, the first board-certified obstetrician and gynecologist by Linda Holmes; and Dr. Sarah F. Mackintosh, the first woman member of the Medical Society of New Jersey by Geraldine Hutner.

Publication of this issue of NEW JERSEY MEDICINE was aided by a grant from the  New Jersey Committee for the Humanities. The views expressed herein are not necessarily those of the New Jersey Committee for the Humanities. Special thanks to La Verne Fioretti for planting the idea for the creation of this project.

Estelle Brodman, PhD, Guest Editor

"The Power of the Pen"

When you decide to use Bactrim, use the power of the pen as well. Protect your prescribing decision in accordance with your state regulations to prevent substitution. It guarantees your patients will get the power of Bactrim.

AUTHOR INFORMATION

New Jersey Medicine is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in New Jersey Medicine is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable manuscript based on a presentation made in New Jersey.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

For urinary tract infection

Illustration of
Bactrim power
in urinary tract
infection.

Bactrim Power

- Penetrates
- Concentrates
- Overpowers
- Persists

Bactrim penetrates all tissues¹ to overpower most common susceptible uropathogens including *E. coli*, *Klebsiella* species, *Enterobacter* species, *Morganella morganii*, *Proteus* (in vitro) year after year.² B.i.d. dosing, easy transition from IV to oral, and economy help keep successful therapy within your power. Especially when you remember to protect your prescribing decision by specifying D.A.W.

Please note that *in vitro* data may not correlate with clinical experience. Bactrim is contraindicated in infants less than two months of age, in pregnancy at term, during lactation, and in documented megaloblastic anemia due to folate deficiency. Maintain adequate fluid intake.

Specify *"Dispense as written"*

Bactrim™ DS

(160 mg trimethoprim and 800 mg sulfamethoxazole/Roche)

Please see references and summary of product information on following page.

ROCHE

Specify "Dispense as Written," "Do Not Substitute," or "Brand Necessary" according to your state regulations.

Bactrim™

(trimethoprim and sulfamethoxazole/Roche)

Before prescribing, please consult complete product information, a summary of which follows:
CONTRAINDICATIONS: Hypersensitivity to trimethoprim or sulfonamides; documented megaloblastic anemia due to folate deficiency; pregnancy at term and during the nursing period; infants less than two months of age.

WARNINGS: FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS.

BACTRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. Clinical signs, such as rash, sore throat, fever, arthralgia, cough, shortness of breath, pallor, purpura or jaundice, may be early indications of serious reactions. In rare instances a skin rash may be followed by more severe reactions, such as Stevens-Johnson syndrome, toxic epidermal necrolysis, hepatic necrosis or serious blood disorder. Perform complete blood counts frequently. **BACTRIM SHOULD NOT BE USED IN THE TREATMENT OF STREPTOCOCCAL PHARYNGITIS.** Clinical studies show that patients with group A β -hemolytic streptococcal tonsillopharyngitis have a greater incidence of bacteriologic failure when treated with Bactrim than with penicillin.

PRECAUTIONS: General: Give with caution to patients with impaired renal or hepatic function, possible folate deficiency (e.g., elderly, chronic alcoholics, patients on anticonvulsants, with malabsorption syndrome, or in malnutrition states) and severe allergies or bronchial asthma. In glucose-6-phosphate dehydrogenase deficient individuals, hemolysis may occur, frequently dose-related.

Use in the Elderly: May be increased risk of severe adverse reactions in elderly, particularly with complicating conditions, e.g., impaired kidney and/or liver function, concomitant use of other drugs. Severe skin reactions, generalized bone marrow suppression (see WARNINGS and ADVERSE REACTIONS) or a specific decrease in platelets (with or without purpura) are most frequently reported severe adverse reactions in elderly. In those concurrently receiving certain diuretics, primarily thiazides, increased incidence of thrombocytopenia with purpura reported. Make appropriate dosage adjustments for patients with impaired kidney function (see DOSAGE AND ADMINISTRATION).

Use in the treatment of Pneumocystis Carinii Pneumonia in Patients with Acquired Immunodeficiency Syndrome (AIDS): AIDS patients may not tolerate or respond to Bactrim in same manner as non-AIDS patients. Incidence of side effects, particularly rash, fever, leukopenia, elevated aminotransferase (transaminase) values, with Bactrim in AIDS patients treated for *Pneumocystis carinii* pneumonia reported to be greatly increased compared with incidence normally associated with Bactrim in non-AIDS patients.

Information for Patients: Instruct patients to maintain adequate fluid intake to prevent crystalluria and stone formation.

Laboratory Tests: Perform complete blood counts frequently; if a significant reduction in the count of any formed blood element is noted, discontinue Bactrim. Perform urinalyses with careful microscopic examination and renal function tests during therapy, particularly for patients with impaired renal function.

Drug Interactions: In elderly patients concurrently receiving certain diuretics, primarily thiazides, an increased incidence of thrombocytopenia with purpura has been reported. Bactrim may prolong the prothrombin time in patients who are receiving the anticoagulant warfarin. Keep this in mind when Bactrim is given to patients already on anticoagulant therapy and reassess coagulation time. Bactrim may inhibit the hepatic metabolism of phenytoin. Given at a common clinical dosage, it increased the phenytoin half-life by 39% and decreased the phenytoin metabolic clearance rate by 27%. When giving these drugs concurrently, be alert for possible excessive phenytoin effect. Sulfonamides can displace methotrexate from plasma protein binding sites, thus increasing free methotrexate concentrations.

Drug/Laboratory Test Interactions: Bactrim, specifically the trimethoprim component, can interfere with a serum methotrexate assay as determined by the competitive binding protein technique (CBPA) when a bacterial dihydrofolate reductase is used as the binding protein. No interference occurs if methotrexate is measured by a radioimmunoassay (RIA). The presence of trimethoprim and sulfamethoxazole may also interfere with the Jaffe alkaline picrate reaction assay for creatinine, resulting in overestimations of about 10% in the range of normal values.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Carcinogenesis: Long-term studies in animals to evaluate carcinogenic potential not conducted with Bactrim. **Mutagenesis:** Bacterial mutagenic studies not performed with sulfamethoxazole and trimethoprim in combination. Trimethoprim demonstrated to be nonmutagenic in the Ames assay. No chromosomal damage observed in human leukocytes *in vitro* with sulfamethoxazole and trimethoprim alone or in combination; concentrations used exceeded blood levels of these compounds following therapy with Bactrim. Observations of leukocytes obtained from patients treated with Bactrim revealed no chromosomal abnormalities. **Impairment of Fertility:** No adverse effects on fertility or general reproductive performance observed in rats given oral dosages as high as 70 mg/kg/day trimethoprim plus 350 mg/kg/day sulfamethoxazole.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Trimethoprim and sulfamethoxazole may interfere with folate metabolism; use during pregnancy only if potential benefit justifies potential risk to fetus. Nonteratogenic Effects: See CONTRAINDICATIONS section.

Nursing Mothers: See CONTRAINDICATIONS section.

Pediatric Use: Not recommended for infants under two months (see INDICATIONS and CONTRAINDICATIONS sections).

ADVERSE REACTIONS: Most common are gastrointestinal disturbances (nausea, vomiting, anorexia) and allergic skin reactions (such as rash and urticaria). **FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS (SEE WARNINGS SECTION).** **Hematologic:** Agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, neutropenia, hemolytic anemia, megaloblastic anemia, hypoprothrombinemia, methemoglobinemia, eosinophilia. **Allergic Reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, allergic myocarditis, erythema multiforme, exfoliative dermatitis, angioedema, drug fever, chills, Henoch-Schoenlein purpura, serum sickness-like syndrome, generalized allergic reactions, generalized skin eruptions, photosensitivity, conjunctival and scleral injection, pruritus, urticaria and rash. Periarteritis nodosa and systemic lupus erythematosus have been reported. **Gastrointestinal:** Hepatitis (including cholestatic jaundice and hepatic necrosis), elevation of serum transaminase and bilirubin, pseudomembranous enterocolitis, pancreatitis, stomatitis, glossitis, nausea, emesis, abdominal pain, diarrhea, anorexia. **Genitourinary:** Renal failure, interstitial nephritis, BUN and serum creatinine elevation, toxic nephrosis with oliguria and anuria, crystalluria. **Neurologic:** Aseptic meningitis, convulsions, peripheral neuritis, ataxia, vertigo, tinnitus, headache. **Psychiatric:** Hallucinations, depression, apathy, nervousness. **Endocrine:** Sulfonamides bear certain chemical similarities to some goitrogens, diuretics (acetazolamide and the thiazides) and oral hypoglycemic agents; cross-sensitivity may exist. Diuresis and hypoglycemia have occurred rarely in patients receiving sulfonamides. **Respiratory:** Pulmonary infiltrates. **Musculoskeletal:** Arthralgia, myalgia. **Miscellaneous:** Weakness, fatigue, insomnia.

DOSAGE AND ADMINISTRATION: Not recommended for use in infants less than two months of age. **URINARY TRACT INFECTIONS AND SHIGELLOSIS IN ADULTS AND CHILDREN, AND ACUTE OTITIS MEDIA IN CHILDREN:** Usual adult dosage for urinary tract infections is one DS tablet, two tablets or four teaspoonfuls (20 ml) b.i.d. for 10 to 14 days. Use identical daily dosage for 5 days for shigellosis. **Recommended dosage for children with urinary tract infections or acute otitis media:** Is B mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses every 12 hours for 10 days. Use identical daily dosage for 5 days for shigellosis. **Renal Impaired:** Creatinine clearance above 30 ml/min, give usual dosage; 15-30 ml/min, give one-half the usual regimen; below 15 ml/min, use not recommended.

ACUTE EXACERBATIONS OF CHRONIC BRONCHITIS IN ADULTS: Usual adult dosage is one DS tablet, two tablets or four teasp. (20 ml) b.i.d. for 14 days. **PNEUMOCYSTIS CARINII PNEUMONIA:** Recommended dosage is 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

HOW SUPPLIED: DS (double strength) Tablets (160 mg trimethoprim and 800 mg sulfamethoxazole)—bottles of 100, 250 and 500; Tel-E-Dose® packages of 100; Prescription Packs of 20. **Tablets** (80 mg trimethoprim and 400 mg sulfamethoxazole)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Packs of 40. **Pediatric Suspension** (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 100 ml and 16 fl. oz. (1 pint). **Suspension** (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 16 oz (1 pint).

STORE TABLETS AT 15°-30°C (59°-86°F) IN A DRY PLACE PROTECTED FROM LIGHT. STORE SUSPENSIONS AT 15°-30°C (59°-86°F) PROTECTED FROM LIGHT.

P.I. 02BB

June 6-10, 1988

UPDATE YOUR MEDICINE 1988

Association of Practicing Physicians of The New York Hospital and Cornell University Medical College. 33 hours Category 1 credit, (39 if optional workshops taken). A one week review of all subspecialties of internal medicine. 9 major review symposia, 4 lectures, 10 workshops, 2 Meet the Professor luncheons, optional practice workshops in breast/pelvic and male genitorectal examinations. Held at The New York Hospital-Cornell, 1300 York Avenue at 69th Street, New York. Information: Office of CME, 212-472-6119. Dr. Lila A. Wallis is Course Director.

June 11, 1988

8TH ANNUAL ADVANCES IN GASTROENTEROLOGY

Bally's Park Place
Atlantic City, New Jersey

Sponsored by the Gastrointestinal Section of the Hospital of the University of Pennsylvania and the Continuing Medical Education Department of the Underwood Memorial Hospital, Woodbury, New Jersey.

Category 1 credit offered

INFORMATION: Registration Supervisor, SLACK Incorporated, 6900 Grove Road, Thorofare, New Jersey 08086, 609-848-1000.

Not Feminized but Humanized

REGINA MORANTZ-SANCHEZ, PhD

Figure 1. Elizabeth Blackwell, the first woman to receive a medical degree in the United States. (Published with permission. Copyright Archives and Special Collections on Women in Medicine.)

Years ago, when I was in the midst of writing *Sympathy and Science*, I often was invited to speak at medical schools by sympathetic and worried deans who wanted to do something positive for their female students: to give them a sense of their own past. Learning about how women physicians had “coped” in previous generations might stimulate thought and discussion, as well as

aid students in making the difficult transition from woman to professional. My audiences, which were composed primarily of women, were responsive.

Dr. Morantz-Sanchez is the Morris H. Saffron Lecturer for 1988. Requests for reprints can be addressed to Dr. Morantz-Sanchez, 4400 Tomahawk Road, Prairie Village, Kansas 66208.

With their numbers increasing in medical schools, and given the special female qualities women bring to the profession, will women indeed change medicine?

During the question-and-answer period that usually followed, I often was asked one question in particular: With their numbers increasing in medical schools, and given the special "female" qualities that women bring to the profession, will women indeed change medicine? Of course, I always found this question the hardest of all to answer, partly because it is the business of historians to write about the past, not to predict the future. As I groped for a reply, the same theme always shaped my responses. I heard myself saying that if entering medicine meant that women physicians would cease to make the bearing and raising of children a central activity of their lives, then their presence probably would not change the way medicine was organized and practiced at all. Indeed, medicine probably would transform them, by teaching them how to become successful professionals. They would likely readily adopt the ethos and behavior of their male colleagues, and prove that men and women in fact, can be equally accomplished medical practitioners. At the time, I was unaware of why I kept coming back to those same conclusions. My response also troubled me somewhat, because it seemed to link women's biology with a special responsibility to rear children, and implied that women innately harbor special qualities of nurturance. Furthermore, since I really didn't believe that large numbers of women in any profession would stop having children, my answer also suggested that women physicians, in spite of their increasing numbers, might still be so burdened by childbearing that they would remain professionally marginal. As unsatisfying as this response was to me at the time, I kept falling back on it. Only lately, have I begun to suspect that it was not so far off the mark. Indeed, a recent foray into feminist theory has helped me to better formulate those early ideas, and I hope to bring this body of thought to bear in the following discussion of women's past and future role in medicine.

Several different approaches to this important subject are possible. One that readily comes to mind is structural and organizational. I could discuss the meaning of women's preference for salaried positions over private practice, their willingness to choose primary care specialties, the declining prestige and economic clout of the independent practitioner, and how such changes in the past have been linked to the "feminization" of a profession. These are all pressing issues that have profound implications for

social policy and future planning. But my sense is that the average physician is inundated with literature on such topics. Consequently, I prefer a more philosophical posture.

My inclination is to examine the relevance of history to present dilemmas. First, historically, what have been women's contributions to medicine? Have women doctors adjusted themselves uncritically to 20th-century medical professionalization, happy and content to be welcomed as members of the club? Or have some offered an alternative vision of how medicine might be organized and practiced? Second, how can we better understand and interpret this past in the light of feminist theory today? For the last decade feminism has mustered its own critique of medical practice. How much of that critique is justified, and what does it say to male and female practitioners? And, by virtue of their past, what can women doctors today contribute to the healthy self-criticism taking place within the profession, and what particular approaches, if any, can be identified with them?

THE HISTORY OF WOMEN IN MEDICINE

Between 1750 and 1850, industrialization transformed family life and the social meaning of gender roles. Especially important was the appearance of an ideology of domesticity that glorified the separation of the home and public life and extolled the female qualities of nurturing, moral superiority, and maternity. Henceforth, the world of men would be labelled "the public sphere," while the world of women was viewed as "private." Though this ideology appeared at least superficially to reaffirm woman's traditional connection with the home, it equally promised radical change. Women actually gained extraordinary new power in the private sphere, power which they did not have in the patriarchal family economy of the preindustrial period. As the family was romanticized, women were depicted increasingly at its moral and spiritual center. They were assigned a central role in the preservation of values intended to inform, not only family life, but the social institutions for society at large. Suddenly women's role was invested with cosmic moral significance. In time, many women used their new moral power to assert themselves into public life. In doing so, they played an important part in 19th century social reform. Such activity paved the way first for women's education, and then for their entrance into

professions like teaching, medicine, social work, librarianship, nursing, and, in the 20th century, law.

Women doctors were among those 19th-century female activists who worked to carry domestic values into the public sphere. Armed with their belief in women's natural gifts as healers and nurturers, they envisioned themselves as physicians who could combine "feminine" sympathy with "masculine" science. Indeed, Elizabeth and Emily Blackwell called women physicians the "connecting link" between the science of the medical profession and the everyday life of women, arguing that they were "for the purpose of occupying positions men cannot fully occupy, and exercising an influence which men cannot wield at all."¹

But why was "science" increasingly viewed as "masculine" at the end of the 19th century? An answer to this question lately has been offered by historians of science, who have begun to study the evolution of the contemporary ideology of science. These scholars have vividly described how scientists from the 17th century on gradually succeeded in legitimating an approach to knowledge which was allegedly dispassionate, precise, and subject to suitable tests of proof. Building on this fascinating work, feminist scholars have shown how the language of science served, not only to validate a specific kind of inquiry—for example, laboratory experiments under suitable controls, the precise measuring and counting of results, the repetition of protocols, and the publication of findings—but also denigrated and devalued more subjective and informal modes of knowing. Francis Bacon, one of the founders of modern science, filled his writings with patriarchal metaphors depicting mind as masculine, nature as feminine, and science as a marriage between the two. Devoid of mind, nature was to be conquered, subdued, and controlled. Gradually, more subjective forms of knowledge, which had played an important role in traditional branches of medieval science like alchemy, persistently became identified with the feminine. The result is a legacy of gendered cultural dichotomies with which we are all very much familiar—dichotomies like male/female, objective/subjective, culture/nature, active/passive, rational/emotional, and public/private.²

Contemporary feminist theorists have begun to ferret out the destructive, even dangerous aspects of this intellectual legacy, not only for our culture, but for the pursuit of science itself. In particular, they have challenged the sharp opposition between "masculine" reason and "feminine" intuition. They have critiqued the philosophical assumptions asserting that women's close connection with organic life has kept them from the world of reason, and they carefully have scrutinized the relationship between what most women "do" in our society and intuitive,

more subjective ways of knowing. Though there is a growing literature on this subject, I would like to look just briefly at this strain of feminist thinking in order to gain some insight into the historical legacy of women physicians.^{3,8}

In an important article entitled "Maternal Thinking," the philosopher Sara Ruddick proposes to revise common assumptions about mothering which contrast the abstract and formal ideas of men's traditional explorations with the more "informal" modes of thought involved in childrearing. She takes special issue with an underlying tenet of this dualistic thinking—the idea that because society has relegated mothering to a private, less structured and more "natural" sphere of existence, a mother's knowledge is not as legitimate or as acceptable as what men do. She proposes instead, that a mother "engages in a discipline" just as systematic as the pursuit of medicine or law, that reason is an essential component of a mother's knowledge, and that "maternal thinking" is an activity which deserves to have its forms recognized. Indeed, she goes one step further: she suggests that analyzing and describing this type of thought—a form of knowing shaped by maternal practices—can lead eventually toward the creation of a new public ethic with a greater emphasis on caring.⁹

Ruddick is not alone among those who have taken issue with the presumption that legitimate reasoning occurs only within the realm of masculine activities like science and mathematics. Several scholars have shown that the devaluation of women's intuition derives from a more general cultural suspicion of all forms of knowledge which are nonscientific. Moreover, recent developments in a wide range of disciplines have demonstrated the inadequacy of using the scientific model as an absolute measure of what counts as knowledge.¹⁰ Many scholars are calling for a redefinition of the notions of subjectivity and objectivity. They argue, for example, that women's activities in the domestic sphere, particularly childrearing, require preparation, foresight, experience, training, and, ultimately, the ability to reason. Of course, most mothers love their children and respond to their needs. But that response is not random or automatic. Even maternal feelings are not instinctive, but the product of thought, knowledge, and experience. In the process of living with children, mothers, Ruddick argues, "acquire a conceptual scheme—a vocabulary and logic of connections through which they order and express the facts and values of their practice." This knowledge and experience exhibits a much greater emphasis on the particular and the individual than does that of a mathematician or theoretical physicist. Indeed, because much of mothering entails the fostering of emotional and intellectual growth, a duty which re-

quires responding to a being (object) which is continually growing, changing, and intentionally moving away, a mother's task involves a willingness and ability to gradually alter her relationship with her child. "The idea of 'objective reality' itself," Ruddick observes, paraphrasing philosopher and novelist Iris Murdoch, "undergoes important modification when it is to be understood, not in relation to 'the world described by science,' but in relation to the progressing life of a person." It is this "unity of reflection, judgment, and emotion" which Ruddick labels "maternal thinking."

Ruddick's article is one of several recent attempts to critique and ultimately modify the radical separation between subject and object that has become characteristic of scientific thinking in the last 300 years.

Scholars who share Ruddick's approach seek nothing less than the incorporation into scientific discourse of a different form of knowing, one which makes effective use of subjective experience. For example, the physicist, Evelyn Fox Keller argues that objectivity as it has been previously understood, is too "static." It begins with the erroneous assumption that one in fact can sever oneself completely from the object of study, and hence regard one's investigations as unbiased and absolute. She proposes instead an expanded mode of knowing which she calls "dynamic objectivity." Its aim is to grant "to the world around us its independent integrity," but to do so "in a way that remains cognizant of, and indeed relies on, our connectivity with that world." Keller seeks a special kind of empathy, "a form of knowledge of other persons that draws explicitly on the commonality of feelings and experience in order to enrich one's understanding of another in his or her own right."³

None of these thinkers believe that such a form of knowing is dependent on women's biology or even always is female. They argue only that women in our society usually are taught maternal thinking, while men are not. Some scholars have connected such thought patterns to minority groups—blacks and Chicanos, for example—and suggest that this special form of empathy arises from the experience of subordination. Whatever its origin, the object of

Figure 2. Palma E. Formica, MD, the first woman president of the Medical Society of New Jersey.

their analysis is to abstract such thinking temporarily from its social context and measure it against more traditional methods of scientific inquiry. Feminists argue that traditional objectivity actually constrains science, and offer an alternative paradigm which stresses the interaction between the knower and the known. The goal is an expanded and more effective theory of knowledge—one which can better accommodate, not only the pursuit of science, but the develop-

ment of a more holistic and life affirming culture.

If it seems I have moved far afield from the subject of women doctors, it has been a digression with a purpose. My argument is that contemporary feminist and philosophical theory can help us better understand women physicians' past approach to the organization and practice of medicine and can explain why some of them had difficulty adjusting to 20th-century medical professionalization. Perhaps, too, such theory can help guide women physicians today as they struggle with the question of their role in medicine.

With the bacteriological revolution at the end of the 19th century, women doctors confronted a tension between sympathy and science in medicine—a tension which they themselves helped make a public issue.

Women physicians had entered the profession believing in women's abilities to alleviate pain and suffering. They had wrestled with their dual identities as women and as doctors. They had emphasized the importance of prevention over cure and the duty of doctors to bring about social reform. Yet, until bacteriology injected a specific kind of science into medical practice, they functioned in an atmosphere colored by an older concept of professionalism, accepted by both sexes, which maintained a place for subjective forms of knowing and stressed the therapeutic powers of moral and social concerns.¹²

Elizabeth Blackwell, for example, taught that every good physician, male or female, must possess what she called "the spiritual power of maternity." Although she once called motherhood a "remarkable specialty," it was not merely "the material aspect" of motherhood which intrigued her. Indeed, she emphasized that it was a mistake to view motherhood purely in its physical sense. What made

mothering so compelling was the "spiritual principles" which underlay the ordinary tasks that most mothers daily performed. Indeed, for Blackwell, maternity had much in common with Erik Erikson's idea of generativity, a concept that he defines as "the concern in establishing and guiding the next generation." Like Erikson, Blackwell interpreted the "spiritual power" of maternity in the broadest possible terms. Not only physicians, but all mankind must learn the lessons it had to teach, whether individuals actually had children or not. And what were these lessons? "The subordination of self to the welfare of others; the recognition of the claim which helplessness and ignorance make upon the stronger and more intelligent; the joy of creation and bestowal of life; the pity and sympathy which tend to make every woman the born foe of cruelty and injustice; and hope . . . which foresees the adult in the infant, the future in the present." These, Blackwell insisted, were great "moral tendencies"; they were insights derived from the social practices of mothering, and they could not be measured or reproduced in the laboratory.¹³⁻¹⁵

In her emphasis on the spiritual power of maternity, I believe Blackwell was making a case for the importance of "maternal thinking" to medical therapeutics. Outside of the domestic life itself, she wrote in 1891, there was no other occupation as noble as the practice of medicine. But medical study involved the preservation of qualities—"tenderness, sympathy, guardianship,"—which she identified with mothering. The skills women learned in caring for children must be taught to everyone, especially physicians. These, combined with the more objective methods of scientific inquiry, formed the essence of what Blackwell believed was "true" scientific medicine.

Elizabeth Blackwell was not an isolated thinker among women physicians. The majority of her female colleagues continued well into the 20th century to offer a morally distinct alternative to the prevailing vision of scientific medicine emerging as a result of the bacteriological revolution. Blackwell's own New York Infirmary for Women and Children, founded in 1854, boasted of one of the earliest outpatient dispensaries, which included home visits to the poor to teach hygiene and preventive medicine. Similar institutions founded by female medical graduates in the 19th century focused on the problems of women and children, and took a strong interest in preventive medicine and public health. My own comparison of male and female therapeutics at two obstetrical hospitals during this period has revealed that, although differences in the mechanics of obstetrical practice were minimal, subtle, but important variations in physician-patient interaction may have made the experience of being treated by

a woman physician a more positive one for the patient. For example, women doctors made rounds more often than men, and prescribed mild supportive therapies while the men did not. The women concerned themselves with their patients' social situations. Many an unmarried mother was settled in a job after she left the hospital, and countless poor patients were kept long after their recovery until proper housing could be found for them. Even today, studies reveal that women physicians often spend more time with their patients and usually take a more thorough history.¹⁶

In the early decades of the 20th century, as the one surviving women's medical college—the Woman's Medical College of Pennsylvania—struggled with mounting debts, it maintained its reputation for training excellent clinicians. Finally, women physicians' participation in social medicine and public health far outweighed their proportion in the profession, a fact which suggests that Blackwellian concerns with holistic approaches continued to be important to them well into the era of of experimental science, technology, and specialization. In their emphasis on patient care, they demonstrated a form of "maternal thinking" which was surely rooted in their separate experience as women. Perhaps their activities stand as historical proof of the existence of "the spiritual element of maternity."

Even as they welcomed the new scientific discoveries, women physicians worried that technology would threaten traditional approaches to patient care. Perhaps some of their fears have come to pass. The triumph of a concept of objective, value-free science has allowed biomedical researchers to divorce themselves from the social uses of their knowledge, ignoring questions of morality. Scientists now are capable of performing a whole range of procedures in the area of reproductive technology and genetic engineering, for example, which have the potential to profoundly and irrevocably alter our environment and the structure of our social institutions. Moreover, researchers generally have left it to the public to monitor the application of this work. Yet, they have rarely troubled themselves to interpret the meaning or implications of their findings in language that the public can readily understand. They have left that task to others less qualified than themselves, and the result too often has been distortion and public misinformation.

In the last decade, critics from within the medical profession have joined forces with the lay public and detractors from a variety of disciplines to decry a "model of disease no longer adequate" to its scientific tasks or social responsibilities. "Medicine's crisis," the psychiatrist George L. Engel has written, "stems from the logical inference that since 'disease' is defined in terms of somatic parameters, physi-

The two houses (on the left) make up the original location of the Women's Medical College of the New York Infirmary; these were located on lower Second Avenue, New York City.

Figure 3. Mural by Josephine Truslow Adams depicting the New York Infirmary and the Women's Medical College of the New York Infirmary. (©Courtesy of the New York Infirmary, Downtown Beekman Hospital.)

cians need not be concerned with psychosocial issues which lie outside medicine's responsibility and authority." Like Elizabeth Blackwell before him, Engel deplores the persistence of a "mind-body dualism" in medical thinking which assumes that the whole can be understood, "both materially and conceptually by reconstituting the parts." Unlike Blackwell, Engel is in a much better position to acknowledge the extraordinary achievements of scientific medicine in the last 100 years. And so he does. But, he warns, these have come mostly at the price of promoting "an approach to disease that neglects the patient." He notes that younger physicians increasingly are forced to confront the contradictions between the "excellence of their biomedical background" and the "weakness of their qualifications . . . essential for good patient care."

Some challenges to contemporary practice have ascribed to the ascendancy of biomedical reductionism a health care system that exhibits such undesirable procedures "as unnecessary hospitalization, overuse of drugs, excessive surgery, and inappropriate utilization of diagnostic tests." Agrees another physician-critic, Dr. Halsted Holman, "While reductionism is a powerful tool for understanding, it also creates profound misunderstanding when unwisely applied. Reductionism is particularly harmful when it neglects the impact of nonbiological circumstances upon biologic processes . . . some medical outcomes are inadequate not because ap-

propriate technical interventions are lacking, but because our conceptual thinking is inadequate." Clearly, what is needed is a biosocial model of disease much like the one women physicians proposed over a century ago. Such a model, while possibly diminishing the authority of the physician, would readmit the patient's subjectivity as legitimate in diagnosis and in healing.¹⁷

A century ago, women physicians practiced in a medical world which rapidly was devaluing subjective forms of knowing, forms which were becoming increasingly identified with the feminine. The bacteriological revolution helped to discredit the "art" of medicine in favor of technological expertise and laboratory experimentation. More and more after 1880, subjectivity would be viewed as counterproductive, even in patient care. These changes had an important effect on the way medicine was organized and practiced. Incorporating biomedical reductionism, medical professionalization eventually engendered a caste system among health care personnel which split off caring from curing. Eventually, medicine became a less congenial profession for women than it had been in the 19th century, and they remained a marginalized minority well into the 1970s.

It appears to me that the cost of that marginalization to medicine itself has been quite dear. First, the exclusion of women from a significant role in shaping 20th century medical professionalization

has meant the loss of a theory of knowing often, though not solely, derived from the primarily female activities of nurturing, generating, and caring. What has been reinforced instead, is a narrow and rigid cognitive stance that has confined subjective forms of knowing increasingly to the realm of art, literature, and the private world of the family. The labeling of subjectivity as feminine, and its consequent devaluation, has banished its effectiveness even for the women who successfully have entered the profession. The supposedly gender-blind concept of scientific objectivity actually has been modeled only on a single, more "masculine" way of knowing—one which rigidly separates subject from object, the knower from the known. This development has distanced patient from practitioner, an outcome particularly problematical because medicine is the most interpersonal of all the sciences.

Two contemporary examples of the dimensions of this loss may serve to illustrate my point. The first merely cites the absence of clinicians capable of treating patients with empathy and humanity. Melvin Konner, an anthropologist who, in his mid-30s, fulfilled a lifetime dream of going to medical school, speaks poignantly in his recent book of one of his first encounters with a caring clinician/teacher:

I did not fully appreciate while I was taking basic clinical skills that I was being exposed to two of the best clinical teachers I would encounter in medical school. One was Ross Weinberger, the internist who was my primary supervisor in most of the patient evaluations. He was a socially awkward man with a beak nose and heavy glasses, and an asthenic, slightly stooped frame. He worked for a community health plan with an excellent reputation and he seemed to have no academic ambitions. His general grasp of internal medicine seemed as good as that of anyone I met before or since, but that was not the point really. He was simply with the patients in a way I would rarely see again. He had a penetrating gaze that was medically critical yet full of convincing practical warmth. . . . He cared, professionally, about the nonmedical aspects of his patients' problems—their characters, their families, their living situations, their incomes. Ignorant as I was, I made the mistake of taking all this for granted. I assumed I had had some bad breaks in certain teaching encounters during the preclinical years, and that now I was embarked on an apprenticeship journey under the command of real doctors. Little did I realize with what longing I would later look back on Dr. Weinberger's simple human decency.¹⁹

My second example of how the concept of scien-

tific objectivity has distanced patient from practitioner has to do with the dynamics of medical decision making between doctor and patient. Two recently published books on informed consent tell strikingly similar stories in their introductions. In his book, *The Silent World of Doctor and Patient*, Dr. Jay Katz recounts the story of a close friend—a university professor—who sought his advice after a surgeon recommended immediate excision of the gallbladder following his friend's first acute attack. The surgeon had not mentioned the possibility of no treatment and watchful waiting as an alternative, although such an option was equally medically sound. Katz suggests a number of reasons for the surgeon's refusal to include the patient in the decision—the belief that patients are incapable of understanding the complexity of diagnosis and treatment, the assumption that patients wish doctors to decide for them, and the fact that long explanations take too much time. But the one that stands out is Katz's suggestion that the surgeon probably believed explanation unnecessary, because doctor and patient shared an identity of interest in medical matters. Such an extraordinary assumption can follow only if, in his own mind, the doctor radically separates the patient from the disease. To treat the whole patient, Katz observes, would have required the surgeon to recognize that "physicians' personal and professional experience and preference may dictate one course; the patients' needs, expectations, and preferences another one." In other words, the physician would have had to consider the patient's subjectivity—including his life outside the hospital room—in the decision-making process.²⁰

In her study of the treatment of female patients, *In the Patient's Best Interest*, the medical sociologist Sue Fisher tells a similar story about herself. After six years of observing the delivery of health care to women in various clinical settings, she too became a patient when a large ovarian mass was discovered during a routine examination. Newly arrived in the community, she was referred by a nurse-practitioner to a gynecologist whom she encountered for the first time while lying on her back with her feet in stirrups. After a brief examination, his nurse ushered her into his consulting room, where Fisher listened as the doctor explained that she needed to be hospitalized as soon as possible for tests, followed by a total hysterectomy. No other information was offered, nor were alternative choices for treatment discussed. When she asked why a hysterectomy must be performed even if the mass was not malignant, her doctor explained that a woman her age no longer needed her uterus or ovaries, since she would soon be going through menopause and could be managed quite successfully on estrogens. In the book, Fisher recalls:

I paid the bill and left the office . . . a lot less confident about my ability to cope during medical interactions. I knew from my previous research that the institutional authority of the doctor's role provided an interactional edge for the physician that placed the patient at a disadvantage. But I had been totally unprepared for how great that disadvantage would be for me—a well-informed professional woman. Somehow, I had assumed my research provided me with an immunity. My field of study is medical interaction. I am armed with the medical knowledge and social skill to interact with medical personnel as a competent person. Yet I fared no better than most of the patients I have studied.

In a visit to a second gynecologist, Fisher had a slightly more positive experience. Although he, too, recommended total hysterectomy on the grounds that she no longer needed her uterus, when pushed, he reluctantly acknowledged that limited surgery also was a medically sound alternative. Each of these stories suggests that meaningful collaboration between physicians and patients has been given short shrift in this age of science, where, Jay Katz reminds us, the expectation is that treatment requires only "silent scalpels, wordless monitors, and mute pharmacological agents."²¹

Modern medical practice surely has suffered from these painful and anxiety-ridden encounters between doctor and patient, and public disaffection in the last several years has taken forms too numerous to mention. I suggest that marginalizing women physicians at the beginning of this century may have exacerbated those tensions. In addition, the absence of women has allowed medicine to be organized and

practiced almost exclusively according to the male life cycle. In our culture, such a lifestyle rarely is compatible with having babies or being intimately and integrally involved in their nurture and growth. And yet, many psychologists agree with Eric Erikson that the experience of generativity is an essential stage in the adult maturation process. But, the demanding routine of medical practice, call schedules, and residency requirements, has penalized or completely excluded men and women wishing to participate in a full and satisfying personal life. It goes without saying that such developments have weighed especially heavily on women. But they also effectively have barred the male physician who sincerely believes that a person with family ties, human emotions, and diverse intellectual interests, makes for a more effective healer. My point is not that all women doctors must run out and have babies. Feminists have justly fought long and hard for the right of individual women to choose from a range of lifestyles other than marriage and a family. What I do believe, however, is that the professional ethos which has hitherto shaped medical education and practice must make room for family and personal life. This change will positively affect patient care and minimize present problems in the selection and training of physicians. What the profession needs now is a healthy dose of "the spiritual power of maternity." Accomplishing such a goal would mean, not just the effective reorganization of medical practice, an imminent development in any case, but the revival of a more holistic version of medical science—one which women doctors advocated over a century ago—at a time when few people were prepared to listen. ■

Consider the causative organisms...

Ceclo[®]
cefactor

250-mg Pulvules[®] t.i.d.

**offers effectiveness against
the major causes of bacterial bronchitis**

H. influenzae*, *H. influenzae*, *S. pneumoniae*, *S. pyogenes
(ampicillin-susceptible) (ampicillin-resistant)

Brief Summary. Consult the package literature for prescribing information.

Indications and Usage. Ceclo[®] (cefactor, Lilly) is indicated in the treatment of the following infections when caused by susceptible strains of the designated microorganisms:

Lower respiratory infections, including pneumonia caused by *Streptococcus pneumoniae* (*Diplococcus pneumoniae*), *Haemophilus influenzae*, and *S. pyogenes* (group A beta-hemolytic streptococci).

Appropriate culture and susceptibility studies should be performed to determine susceptibility of the causative organism to Ceclo.

Contraindication. Ceclo is contraindicated in patients with known allergy to the cephalosporin group of antibiotics.

Warnings. IN PENICILLIN-SENSITIVE PATIENTS, CEPHALOSPORIN ANTIBIOTICS SHOULD BE ADMINISTERED CAUTIOUSLY. THERE IS CLINICAL AND LABORATORY EVIDENCE OF PARTIAL CROSS-ALLERGENICITY OF THE PENICILLINS AND THE CEPHALOSPORINS, AND THERE ARE INSTANCES IN WHICH PATIENTS HAVE HAD REACTIONS, INCLUDING ANAPHYLAXIS, TO BOTH DRUG CLASSES.

Antibiotics, including Ceclo, should be administered cautiously to any patient who has demonstrated some form of allergy, particularly to drugs.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics (including macrolides, semisynthetic penicillins, and cephalosporins); therefore, it is important to consider its diagnosis in patients who develop diarrhea in association with the use of antibiotics. Such colitis may range in severity from mild to life-threatening.

Treatment with broad-spectrum antibiotics alters the normal flora of the colon and may permit overgrowth of clostridia. Studies indicate that a toxin produced by *Clostridium difficile* is one primary cause of antibiotic-associated colitis.

Mild cases of pseudomembranous colitis usually respond to drug discontinuance alone. In moderate to severe cases, manage-

ment should include sigmoidoscopy, appropriate bacteriologic studies, and fluid, electrolyte, and protein supplementation. When the colitis does not improve after the drug has been discontinued, or when it is severe, oral vancomycin is the drug of choice for antibiotic-associated pseudomembranous colitis produced by *C. difficile*. Other causes of colitis should be ruled out.

Precautions: General Precautions—If an allergic reaction to Ceclo[®] (cefactor, Lilly) occurs, the drug should be discontinued, and, if necessary, the patient should be treated with appropriate agents, e.g., pressor amines, antihistamines, or corticosteroids.

Prolonged use of Ceclo may result in the overgrowth of nonsusceptible organisms. Careful observation of the patient is essential. If superinfection occurs during therapy, appropriate measures should be taken.

Positive direct Coombs' tests have been reported during treatment with the cephalosporin antibiotics. In hematologic studies or in transfusion cross-matching procedures, when antiglobulin tests are performed on the minor side or in Coombs' testing of newborns whose mothers have received cephalosporin antibiotics before parturition, it should be recognized that a positive Coombs' test may be due to the drug.

Ceclo should be administered with caution in the presence of markedly impaired renal function. Under such conditions, careful clinical observation and laboratory studies should be made because safe dosage may be lower than that usually recommended.

As a result of administration of Ceclo, a false-positive reaction for glucose in the urine may occur. This has been observed with Benedict's and Fehling's solutions and also with Clinistix[®] tablets but not with Tes-Tape[®] (Glucose Enzymatic Test Strip, USP, Lilly).

Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.

Usage in Pregnancy—Pregnancy Category B—Reproduction studies have been performed in mice and rats at doses up to 12 times the human dose and in ferrets given three times the maximum

human dose and have revealed no evidence of impaired fertility or harm to the fetus due to Ceclo[®] (cefactor, Lilly). There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers—Small amounts of Ceclo have been detected in mother's milk following administration of single 500-mg doses. Average levels were 0.18, 0.20, 0.21, and 0.16 mcg/ml at two, three, four, and five hours respectively. Trace amounts were detected at one hour. The effect on nursing infants is not known. Caution should be exercised when Ceclo is administered to a nursing woman.

Usage in Children—Safety and effectiveness of this product for use in infants less than one month of age have not been established.

Adverse Reactions: Adverse effects considered related to therapy with Ceclo are uncommon and are listed below.

Gastrointestinal symptoms occur in about 2.5 percent of patients and include diarrhea (1 in 70).

Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment. Nausea and vomiting have been reported rarely.

Hypersensitivity reactions have been reported in about 1.5 percent of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of serum-sickness-like reactions (erythema multiforme or the above skin manifestations accompanied by arthritis/arthralgia and, frequently, fever) have been reported. These reactions are apparently due to hypersensitivity and have usually occurred during or following a second course of therapy with Ceclo. Such reactions have been reported more frequently in children than in adults. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.

Cases of anaphylaxis have been reported, half of which have

occurred in patients with a history of penicillin allergy. Other effects considered related to therapy included eosinophilia (1 in 50 patients) and genital pruritus or vaginitis (less than 1 in 100 patients).

Causal Relationship Uncertain—Transitory abnormalities in clinical laboratory test results have been reported. Although they were of uncertain etiology, they are listed below to serve as alerting information for the physician.

Hepatic—Slight elevations in SGOT, SGPT, or alkaline phosphatase values (1 in 40).

Hematopoietic—Transient fluctuations in leukocyte count, predominantly lymphocytosis occurring in infants and young children (1 in 40).

Renal—Slight elevations in BUN or serum creatinine (less than 1 in 500) or abnormal urinalysis (less than 1 in 200).

[0617B2R]

Note. Ceclo[®] (cefactor, Lilly) is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-allergic patients.

Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. See prescribing information.

**“A fee-for-service insurance program
with complete office coverage?”**

**I don't
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

When you asked for a fee-for-service insurance program with comprehensive medical coverage, we listened. Because we all share a common concern, the welfare of your patient.

And when you told us fee-for-service had to cover all your in-office claims, we heard you.

Together we've developed Medallion, the best insurance for a healthy practice—and your patients.

Comprehensive fee-for-service.

The insurance program you want with the comprehensive medical coverage your patients need, including office visits, well child care and unlimited laboratory and X-ray services. Just bill your usual charges for each and every service you perform.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

A Century of Women Physicians

ESTELLE BRODMAN, PhD

Figure 1. Medical schools attended by women, 1886-1950.

The inauguration of the first woman President of the Medical Society of New Jersey, some 200 years after the founding of the Society, brings to the forefront questions about the circumstances of women physicians in New Jersey

over the years. Unfortunately, no complete, fairly standardized compilation of data exists about women physicians in the United States before 1886, when Polk began to publish a directory of all the physicians in the country.¹ Polk's series continued for a number of years; it was joined in 1904 by the American Medical Association's *American Medical Directory*.² As directories are arranged geograph-

ically, it is possible to determine such personal facts as ages, medical schools attended, places of practice, specialties (if any), and retirement dates of New Jersey women physicians.

Some of the questions investigated were: How many wom-

en practiced medicine in New Jersey in the century from 1886 to 1982? Where were they educated?

Dr. Brodman is Guest Editor and Librarian and Professor of Medical History Emerita, Washington University School of Medicine, Saint Louis. Requests for reprints can be addressed to Dr. Brodman, 19-09 Meadow Lakes, Hightstown, NJ 08520.

Figure 2. Medical schools attended by New Jersey women physicians, 1961.

Figure 4. American medical schools attended by New Jersey women physicians, 1982.

Where did they practice? Did they specialize, and if so, in what fields? Was there any indication of their marriage; if so, how did this affect their practice? When did they retire? How did New Jersey statistics compare with the United States as a whole?

METHODOLOGY

To obtain the answers to these questions, it was necessary to compile an index of each woman physician in New Jersey. To read every page of every New Jersey section in all the directories for 100 years would be impossible. It was decided to sample the series by reading and compiling the data in every tenth volume when possible. General data for 1970 already had been collected by a national source; therefore, this material was used. Altogether nine directories were read item by item and the tenth set of data (1970) was obtained from Pennell and Renshaw.³

For each woman as much of the following information as listed was copied: name, and any changes in it over the years; changes in addresses over the years; date of birth or age; medical school attended and year of graduation; places of practice when different from addresses (hospitals or other institutions); special qualifications (national Board approvals, fellowships in professional associations, or faculty status in medical schools); specialties practiced, with indication whether the physician claimed the specialty as primary or secondary; years of directories in which the physician was listed, noting especially claims of "temporary" retirements; and miscellaneous material.

The data (deposited in the Archives of the library of UMDNJ) described accounts for approximately 2,500 women physicians who practiced in New Jersey from 1886 to 1982. The conclusions stated derive from the tables and diagrams appended.*

FINDINGS

The absolute number of women physicians in New Jersey rose from 173 in 1906 to 1,558 in 1982 (Table 1), but there was little variation in the size of the group from 1906 until after World War II, when a large increase occurred. If examined in relation to either the growth in the total population of the state or the number of male physicians, this increase in numbers is not surprising. New Jersey, like most other states, consistently lowered the ratio of physicians to population during the first half of the 20th century. Thus, in 1909, the state had 1 physician for each 1,033 residents; this ratio fell regularly, until 1973 when there was 1 physician for every 426 residents.

World War II also proved to be a watershed for

the ratio of female:male physicians in New Jersey. Before that time, the ratio had varied from 1 female: 12.5 male physicians (in 1906) to 1 female: 28 males (in 1936); but by 1976 this relationship had reversed itself dramatically, showing 1 female: 8.23 males. In this, New Jersey was consistent with the experience of the country as a whole.⁸

Medical Education. Since excellence in medical care is related directly to the medical training received by its practitioners, a study of the medical schools attended by women physicians in New Jersey was undertaken. Tables 2 and 3 and Figures 1 to 4 provide data on the most common medical schools attended at various periods.

In earlier days, women's medical colleges and sectarian schools accounted for much of the education of New Jersey women physicians. As such schools ceased to exist or were absorbed by more "regular" colleges, women medical students went to the standard schools accepting them, e.g. the Women's Medical College of Pennsylvania, which accounted for almost a quarter of all New Jersey women practi-

tioners from 1886 to 1950; the New York Medical College and Hospital for Women which provided another 12 percent; the Women's Medical College of New York Infirmary (later absorbed into Cornell University at the turn of the century) provided 15 percent.

In contrast, by 1961, more than 80 percent of New Jersey women practitioners were graduates of co-educational schools, rather than women's schools. And by 1982, there were no American women's medical colleges still in existence. In spite of this, the Medical College of Pennsylvania could claim to have educated 11 percent of all the New Jersey women physicians practicing in 1982.

The reasons behind the growth and the decline of separate female medical schools in the United States, as well as both the emergence and the decline of sectarian theories of medicine in the 19th century, are well known.^{9,11} The increasing scientific base of medical practice tended to denigrate the sectarian theories of disease causation, while the changing social doctrine of the relationship between the sexes

Figure 5. Most common specialties for women, 1886-1982.

Figure 3. Medical schools attended by New Jersey women physicians, 1982.

Figure 6. Retirements measured from medical school graduation.

in America led to an increase in coeducation in all fields. As would be expected, New Jersey mirrored the larger national situation.

A further change in educational practice is seen in certification. In earlier days, women physicians often presented both state and national Board qualifications; later, as American Specialty Boards appeared, they were certified by these groups. Yet, female physicians consistently held fewer specialty Board qualifications than male physicians through the 1970s.¹²

Foreign Medical Graduates (FMGs). One of the most profound changes in the composition of New Jersey physicians occurred in the years following World War II. Up to that era, most New Jersey physicians were American-trained or graduated from a comparatively small number of European schools. After that period, the influx of those trained in Asian schools was profound. (In the entire United States, 36 percent of all the initial licenses issued by the State Board of Medical Examiners in 1976 were to foreign medical graduates; however, most of these remained in northeast metropolitan areas, of which New Jersey was one.¹³) It is true the number of European-educated physicians increased as well, but this did not occur so massively as was true of the Asian immigration. As a result of this influx, by 1982 the majority of New Jersey women physicians—almost 57 percent of the total—had been trained in foreign medical schools. Of these countries, the Philippines and India, provided, by far, the bulk of the foreign medical graduates (Table 3 and Figure 3). Not only did these two countries provide more than a third of all New Jersey women practitioners in 1982, but within each country one or two schools accounted for the bulk of those practicing in New Jersey. In the Philippines, for example, no fewer than 56 percent of all the Philippine women physicians practicing within the state in 1982 had graduated from the medical school at Santo Tomas Uni-

versity in Manila. In India, with its total of 114 medical schools accepted by the American Medical Association for licensure, graduates of Bombay University and Gujarat University accounted for 30 percent of all Indian women doctors in New Jersey in 1982. The reasons behind these concentrations are unclear.

The explanation of the overall figures must be sought in international political and economic conditions, as well as in the American rules for licensure of medical practitioners which were in effect from the 1950s to the 1980s. In the Philippines, for example, the increasingly dictatorial government combined with the slippage in economic health in the country, led many educated Philippine citizens to seek their fortunes elsewhere. An attempt for a few years by the Philippine government to prohibit the emigration of its professional class as a national "brain drain" ended in the 1970s, leaving the way open for many to come to the United States. And since the Philippines had been under the domination of the United States for almost half a century, English was the official language of the schools and institutions of higher learning; this rendered it easier for emigrants to succeed in the United States. (This also was true of India.) New Jersey was one of the states favored by the Philippine emigres, because of the clusters of compatriots in such cities as Jersey City, Newark, and Camden.

Another reason for the large number of foreign medical graduates was the need of American medical institutions, especially hospitals and long-term medical care institutions, for residents to handle the day-to-day care of the sick. There appeared to be a shortage of physicians in the 1960s and 1970s, especially in urban areas with concentrations of poor people, and in rural areas. Hospitals particularly were hard hit in their attempts to fill their residency vacancies. The immigration of the FMGs helped solve this problem and, thus, was symbiotic for both

*Formerly Women's Medical College of Pennsylvania.

Americans and foreigners alike.

As a result of this situation, a number of other steps were taken by many states, and some were promoted by national medical groups. Some states—such as Missouri and South Dakota—established new medical schools in the hope of furnishing more physicians for rural areas. New Jersey also opened its first medical school during this period, and its success was shown by the fact that by 1982 it was furnishing 19 percent of all women physicians in the state.

Finally, the economic prosperity of the United States in the 1960s and 1970s made it a magnet for those seeking a better life.

Where Women Practiced. The final step taken by many licensure boards required FMGs who wished to practice in the United States to spend at least one year as a resident in a U.S. hospital under the supervision of an American physician. (The Health Professions Educational Assistance Act of 1976 reduced greatly the number of foreign medical graduates training or working in the United States.) An examination of the records of New Jersey women physicians in 1982 shows a large number of them working as house officers in New Jersey hospitals; it will be interesting to compare these records with those for later years to see how many of them remained as regular practitioners in the state.

Throughout the period studied, the vast majority of the women practiced in metropolitan areas, where there was a large population to draw on for patients, and the support of other (often women) physicians was available.

It is said that women physicians often opted for institutional or academic practice, rather than pri-

vate practice, because of its economic reliability and regular hours, allowing women to continue their home and family life. Academic medicine appears to have been chosen by some women for this purpose, even though women seem to be discriminated against in such a setting.¹² In 1972, salaries and retainer fees were the source of income for 31.4 percent of the women physicians, as opposed to 41.7 percent of male physicians.¹⁴

Specialties Practiced. The very earliest 20th century women practitioners in New Jersey rarely reported a specialization; when they did list a specialty, it was likely to be pediatrics, obstetrics, (including gynecology), psychiatry, or anesthesiology. These were "women's specialties" from 1886 to 1982 (Table 4; Figure 5). And, as Pennell and Showell have shown, these specialties were the least well-remunerated of all.³ Not only did the women tend to choose the least well-paid of the specialties, but male physicians in the same specialties garnered incomes 20 percent higher on the average than their female colleagues.

Foreign medical graduates fared even worse than American women physicians. As Rosenthal and Eaton pointed out in 1982, "Female medical graduates occupy a position midway between male medical graduates and foreign medical graduates, and may be pressured to assume some of the FMGs lower-status roles as the number of FMGs decreases."^{14,15}

Retirement. One of the most telling arguments against the admission of women to medical schools had been the belief that women physicians would drop out of the profession earlier than would male physicians, thus wasting the time, energy, and money invested in education. A number of studies

have been offered to show this belief to be erroneous; on the whole, women practice medicine for 32.6 years after graduation, and men 35.8 years.¹⁶

The data collected on retirements for all New Jersey women practicing from 1886 to 1961 are reported in Table 5 and in Figure 6, and show that in the pre-1950 years, retirement did not occur for the majority until 40 years after graduation. In the 1961 cohort, there was a temporary increase in retirements from 11 to 15 years after graduation, but many of these retirees appear to have returned to practice (presumably after their children had grown)

and once again, the most common retirements occurred more than 40 years after starting practice.

CONCLUSIONS

This study of approximately 2,500 women physicians practicing in New Jersey from 1886 through 1982 shows that the patterns in this state were similar to those in the United States as a whole. In the early days, medical school education tended to be in women's or sectarian schools, but later it was in whatever "regular" school would accept women.

Early women physicians offered state and national examination credentials; later physicians had

American Board certifications, but not in the numbers offered by males.

These early women doctors tended to be general practitioners; later physicians specialized in "women's specialties" which paid poorly; moreover, they received less income from these specialties than male physicians in the same areas. For a number of reasons, foreign medical graduates came in great numbers in the 1970s and 1980s, mostly from the Philippines and India, and they often acted as hospital house staffs or worked in hospital-based special-

ties, with minimum recompense. Indeed, a somewhat larger proportion of women—American trained or FMG—than men physicians had hospital-based practices.

Because of their family needs, New Jersey women physicians often opted for specialties with regular hours, and sometimes ceased practice temporarily while their children were young. In spite of this, however, the final retirement figures for women physicians in New Jersey were not very different from those for male physicians. ■

**Names.* The difficulties in distinguishing between male and female names should not be overlooked, because many names are used for males and females or are family names with no indication of sex. *Foreign names.* The enormous increase of foreign medical graduates in the 1970s and 1980s makes it difficult for someone not knowledgeable in the various languages to determine the sex of the individuals listed. Where the given name was known to be female, or where the listing of another physician at the same address—apparently a spouse—was encountered, it was decided that the name was female. If the individual specialized in one of the more common female specialties, it was taken as further

proof. If the individual was a graduate of a female medical school (e.g. Lady Harding Medical College for Women in Delhi), it was assumed that the name represented a woman. *Inconsistency of published data.* The two sets of directories used do not provide the same information about those listed. For example, the birth dates are included in early directories, but not in later ones; similarly, the year of graduation from medical school is found only in lists before the 1970s. This dearth made difficult, if not impossible, the comparison of length of practice before retirement. In addition, specialties were described with different terms at different times, further confusing the comparisons sought over time.

**Kidney stones show up in
some hard-to-reach places.**

**Luckily, the New Jersey
Kidney Stone
Treatment Center
is easy to get to.**

You shouldn't have to go out of your way for lithotripsy services to complement your practice.

The New Jersey Kidney Stone Treatment Center is centrally located in New Brunswick, New Jersey, near statewide highways, for easy access for you and your patients.

The Center is equipped with the latest Dornier HM4 "tubless" lithotripter, which eliminates the need for a water bath. That means easier patient handling, and greater patient comfort.

And the Center is located at a major academic medical center, with full medical back-up. Patients are treated on an outpatient or inpatient basis.

Any board-eligible or board-certified urologist who has completed the ESWL training course and is licensed in the State of New Jersey may apply for privileges at the Center.

Physicians may also refer their patients to the Center for treatment by a member of our medical staff. After the procedure, patients are referred back to their own urologists for follow-up care.

For a credentialing package, or for more information about lithotripsy, call Center Director Diane DiGiulio at 1-800-542-8887, 8 a.m.-5 p.m., Monday-Friday.

New Jersey Kidney Stone Treatment Center

Located at Robert Wood Johnson University Hospital
One Robert Wood Johnson Place
New Brunswick, New Jersey 08901

The New Jersey Kidney Stone Treatment Center is operated by Health Horizons, (ESWL), L.P., affiliated with the following hospitals: Community Memorial Hospital, Freehold Area Hospital, Helene Fuld Medical Center, Jersey Shore Medical Center, Raritan Bay Medical Center, Riverview Medical Center, Robert Wood Johnson University Hospital, St. Francis Medical Center, St. Peter's Medical Center, Somerset Medical Center.

New Jersey Medical Women's Association

SUZANNE A. WIDROW, MD
CHRISTINE E. HAYCOCK, MD

The New Jersey Medical Women's Association (NJMWA) was born in Atlantic City on June 16, 1924. It was conceived by Dr. Clara DeHart Krans (1873-1952) of Plainfield, with the "idea of promoting friendship" among women physicians of the state. It is not recorded in the minutes of the first meeting how many women were present, but it soon became evident that these physicians were anxious to do more than lunch together.¹ Dr. Krans was an active member of the group and worked to help women become accepted as interns in New Jersey hospitals. In 1927, the NJMWA became Branch Four of the American Medical Women's Association (AMWA).

The national organization, AMWA, came into existence in 1915. It was organized by Bertha Van Hoosen, MD, of Chicago, to coordinate the numerous women's medical associations which had formed throughout the country to help women physicians obtain a forum for the exchange of medical information and the maintenance of skills, since they were excluded from membership in the American Medical Association (AMA) and many other medical societies. In 1915, the AMA did begin to accept women as members, and other medical organizations slowly followed suit.²

In 1931, at the suggestion of Mabel Haines, MD (1883-1964), the Clara Krans Research Fund was started by several members of the NJMWA. Carye-Belle Henle, MD (1899-1977), New Jersey's first woman radiologist and the first woman president of the Radiological Society of New Jersey in 1959, became the guardian of this fund. Upon her death, the fund was renamed the Krans/Henle Memorial Fund.

This fund is supported by donations, legacies, and 10 percent of the NJMWA treasury every year. Eighty-five percent of the interest earned is given in the form of outright grants to outstanding women medical students from New Jersey.

There has been a number of extraordinary women physicians in New Jersey during the past 100 years.^{3,6} Although many outstanding women physicians have been members of NJMWA since its inception 64 years ago, it is possible to mention only a few of those women who have worked to advance the status of their sister physicians and of medical practice in New Jersey:

★ **Ellen Potter, MD (1871-1958)** was one of the most prominent early women physicians in New Jersey. She served successfully as director of the medical department of the North Jersey Training School for Feeble-Minded Females at Totowa, then superintendent of the Clinton Reformatory for Women, and the State Home for Girls in Trenton. She was president of Woman's Medical College of Pennsylvania in 1941, and in 1946 formulated the state regulations governing adoption in New Jersey. She served as national president of AMWA in 1929 and was honored by NJMWA as "Woman of the Year" in 1954.³

**Suzanne Allen Widrow, MD, and Christine E. Haycock, MD, are past-presidents of the New Jersey Medical Women's Association. Dr. Haycock is a past-president of the American Medical Women's Association. Requests for reprints can be addressed to Dr. Widrow, 213 River Road, East Hanover, NJ 07936.*

Figure 1. Lena Edwards, MD, as a member of the Hudson County Medical Society.

★ **Stella Bradford, MD (1871-1959)** was director of physical medicine at The Mountainside Hospital from 1932 until 1953. She established the first visiting nurse service in Montclair and the first fresh air school and tuberculosis clinic.³

★ **Vera Schectman, MD (1884-1971)** became the first woman physician on the staff of Newark Beth Israel Medical Center; she outraged some of her friends and colleagues in 1916 by giving lectures on sex education.

★ **Louise Pearce Skillman, MD (1885-1950)** led an expedition through the jungles of Africa and helped develop the drug, tryparsamide, in 1915 for African sleeping sickness. She served twice as president of AMWA.

★ **Rita S. Finkler, MD (1888-1968)** established and headed the first department of endocrinology in New Jersey at Newark Beth Israel Medical Center, and published over 70 papers in the field of endocrinology during the 55 years she practiced in Newark.

★ **Mildred Gregory, MD (1884-1975)** served as medical director of Babies Hospital in Newark from 1949 to 1957, and was one of the first women diplomates of the American Board of Pediatrics.

★ **Jeannette Munro, MD (1894-1986)** was Princeton's first woman pediatrician, and practiced in Mercer County from 1933 to 1965.³

★ **E. Mae McCarroll, MD (b. 1898)** practiced in

Figure 2. Anita Falla, MD, as inaugurated as a member of the MSNJ in 1960 and board certified in 1961.

Newark for 48 years. She led a Newark crusade to stamp out venereal disease, and became the first black physician to be appointed to the staff of Newark City Hospital in 1946. She was named Deputy Health Officer of the city of Newark. Dr. McCarroll was active for over 16 years with the National Medical Association and helped establish its journal. She was honored in 1973 as the First Lady of the National Medical Association.³

★ **Anne Lardner Moore Shannon, MD (1898-1960)** became the first woman physician on the staffs of The Mountainside Hospital and Montclair Hospital, and the only woman surgeon on these staffs.³

★ **Eva Brodtkin, MD (b. 1899)** became the first woman intern at Muhlenberg Hospital, and in 1931, New Jersey's first woman dermatologist. She was president of the New Jersey Dermatological Society and chief of the Dermatology Service at Saint Barnabas Medical Center for many years.³

★ **Jessie D. Read, MD (1903-1979)** was a founding fellow of the American College of Obstetrics and Gynecology. She was one of the first women physicians commissioned in the army from New Jersey in World War II and served as chief of surgery of a hospital unit in Europe.⁵

★ **Mary Bacon, MD (1893-1971)** of Bridgeton was president of Cumberland County Medical Society.

Figure 3. Zelda M. Marks Rosenthal, MD, received the Elizabeth Blackwell award for service in 1980.

Figure 4. In 1961, Christine E. Haycock, MD, became the first board certified woman surgical specialist in New Jersey.

★ **Lena Edwards, MD (1900-1987)** had a long medical career in Jersey City, and despite the disad-

vantage of being both black and female, achieved many honors.

★ **Camille Mermod, MD (1901-1976)** was president of AMWA, in 1954 and 1956, and edited the journal of the association for many years. She was awarded the Elizabeth Blackwell medal in 1965, AMWA's highest award. In 1969, AMWA announced a new award in her honor, which is presented annually to the lay person who has rendered outstanding service to the organization.³

★ **Laura E. Morrow, MD (b. 1913)** was president of AMWA in 1969 and was awarded its Elizabeth Blackwell medal in 1974. She was the first woman president of the Passaic County Medical Society in 1972, and was president of the Society of Clinical Psychiatrists of Northern New Jersey in 1965.³

★ **Anita Falla, MD (b. 1921)** and **Christine Haycock, MD (b. 1924)** were the first women to be board certified surgical specialists in the state in 1961, and Dr. Falla was subsequently elected president of the New Jersey chapter of the American College of Surgeons in 1986.

NJMWA has established county-based units for local meetings, journal clubs, leadership role models, and mentors for medical students and liaisons with these student branches. The organization offers scientific meetings with distinguished speakers held at members' homes, and joint meetings throughout the year with the New Jersey Women Lawyers Association.

Fundraising affairs are held to benefit the Krans-Henle Scholarship Fund and yearly awards are given to deserving medical students. A quarterly newsletter is published and sent to members. There are regional meetings jointly sponsored with the New York branches.

NJMWA is closely involved in the AMWA national programs to prevent cigarette smoking in teenage girls, which is one of the most distressing medical problems in women today. The organization is involved actively with AMWA in furthering the leadership abilities of our members and helping to overcome the under-representation of women in leadership positions in American medical organizations. With the inauguration of Dr. Formica, AMWA hopes young women physicians will become actively involved in organized medicine as a means of effecting change. ■

DONALD F. SMITH & ASSOCIATES

She's A Doctor: Palma Formica

LAURIE A. BARROOD

Salvatore Formica said to his daughter, Palma, "Whatever you want to be, you can be, because you're in America." That was the legacy that helped shape his daughter's future. An immigrant from Sicily, Salvatore worked hard in the local steel mills, determined to provide his family with all the necessities, especially education. He wanted to give his children all the education they could take.

As a child with scarlet fever, Palma Elizabeth Formica remembers the doctor who stayed with her and nursed her back to health. "From that time, I knew I wanted to be a doctor. I didn't know any women physicians, but there was never any doubt in my mind that women could be doctors; plus my parents backed me," she said.

"In those days we were very poor. I had one dress that my Mom would wash for me every night. I was the poor kid with big dreams." How could she know that one day, she would make history.

Palma Formica, MD, is not only the 196th President of the Medical Society of New Jersey, she also is the first woman president of the oldest medical society in the country. It is something she never dreamed would happen, even as she went through the steps.

Palma graduated from Pennsylvania's Johnstown Catholic High School, in 1946, and she completed

a Bachelor of Science degree at the University of Pittsburgh, in two and a half years by going summers as well as winters.

Palma attended medical school in Rome, partly because it was inexpensive. "Money wasn't the only reason, my relatives were there, too. Living in Italy gave me an appreciation of where my roots were," she said.

After graduating in November 1953, she began a rotating internship in internal medicine at Queens Hospital Center, Jamaica, New York. During the last year of an 18-month residency in internal medicine, she married John J. Rihacek and bore her first son, Tad. Unable to continue the hectic pace of residency and pay for child care, she interrupted her training and had son Gregory the next year.

In 1958, Dr. Formica and her family moved to Old Bridge where she opened a family practice. After her third child Alycia was born, she slowly became active in the community and in her church. She joined the Middlesex County Medical Society, the Medical Society of New Jersey, and the AMA; and she became the local fire department and school board

Ms. Barrood is affiliated with the University of Medicine and Dentistry of New Jersey, Newark. Requests for reprints can be addressed to Ms. Barrood, 1494 Carlisle Road, North Brunswick, NJ 08902.

physician for her community.

Dr. Formica loved being a family physician. It was all she had always imagined. More importantly, her real satisfaction was being part of the families she cared for. "No amount of money could ever replace the relationships between me and my patients," she said.

Dr. Formica didn't have the large practice she could have; she felt it was important to be involved in school and church activities as well as in the community, while her children were growing up. "Spending time with my family was very important to me, and I also felt I had a commitment in the community," she said.

The extent of her involvement in the Middlesex County Medical Society was strictly membership. She didn't become actively involved until 1975. She remembers making a comment to one of her colleagues on the Society's nominating committee saying, "The Middlesex Medical Society was nothing but a bunch of old, chauvinistic men. Shortly after my comment, he offered me the position of secretary and bulletin editor. I tried to refuse, knowing I was too busy, but he said, 'Pam, put up or shut up!'"

She became president of the Society in 1977, which resulted in a heavier involvement in the Medical Society of New Jersey, and her upward climb through its ranks.

During that same period, Dr. Formica became more involved in the Department of Family Medicine at St. Peter's Medical Center in New Brunswick. In 1979, she became senior attending and chairman of the Department.

After the death of her husband, Dr. Formica was asked by Dr. Frank Snope and Dr. Joseph Lieberman from the University of Medicine and Dentistry of New Jersey (UMDNJ), to help form a Family Practice Residency Program at St. Peter's for UMDNJ-Robert Wood Johnson Medical School (formerly Rutgers Medical School). She was very flattered about the offer because she never really imagined herself as an academician. It was a huge leap for her from a private practice to a teaching position; but working with students would give her an opportunity to pass on her valuable knowledge.

"I was disturbed by the lack of emphasis placed on the art of medicine for medical students. It seemed to me that the students were losing the 'caring' aspect of medicine," said the doctor. "I wanted to give them a legacy of values I felt were important."

She eventually brought her private practice to St. Peter's and used it in conjunction with the new residency program. "Everything fell together." Although this was not one of her long-term goals, the surrounding circumstances had molded things.

Asked what her position as associate professor of Clinical Family Medicine at UMDNJ-Robert Wood Johnson Medical School means to her, Dr. Formica says it means an 'extension of service' which has guided her through life. "It is a different type (of service) but it is still rendering service to patients and other people," she said. "I am helping to mold attitudes and feelings, I am able to touch lives and value systems. I have great hopes for the future of medicine."

Dr. Palma Formica is not afraid of the road ahead. "I see in young people dedication, ethics, and a desire to provide service. If they do not yield to pessimism, they will find satisfaction and be able to help people live better."

She explained that a general perception about doctors today is that they are in a low ebb in a medical profession hounded by corporations. "I don't see medical professionals as being in a locked step. As long as there is intellectual freedom, the ability to strive, and true dedication, we'll be right there—and not in the hands of the business world."

Dr. Formica attributes her presidency of the Medical Society to the culmination of events that she worked hard to achieve.

"It gives me a great sense of pride to be the first woman president of the oldest medical society in the country," she said. "It's not that I tried to be the first woman of this or that. It just happened." Being the "first woman" places a great burden on her. "It's hard to say no," she explains, "because it sets the pace for other women. I try to encourage women to get involved and stay involved. We are equally as competent as men and we can bring a different perspective to things. There's no magic. Just hard work and some good luck. Women owe it to each other to show that we can run, and we can lose, and still not be losers! We are capable of handling defeat without losing our ideals."

Dr. Palma Formica's entire career reflects her dedication to family, patients, students, and community. A few of her more notable awards have been the Don Quixote Award for Physician of the Year in New Jersey Living Magazine, 1985; the Pope John Paul II, Benemerenti Medal in 1986; and the Edward J. Ill Distinguished Physician's Award from the Academy of Medicine of New Jersey in 1986.

"All of my awards caught me off guard. I'm not trying to be falsely humble, but I've done what I wanted to do with my life! I'm honored that my colleagues thought I deserved to be recognized. I'm lucky to have been able to do all the things I've accomplished. I'm grateful to so many people who have helped me, however, I'm where I am today because of the sacrifices of my parents. They gave me the opportunity to fulfill my dreams." ■

**“A big insurance company
that’s really listening to me?”**

**I don’t
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we’ve developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you’ll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We’re eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey’s medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate with Blue Cross and Blue Shield.

If you’re not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Call 1-800-842-BLUE for more information. Of course, there’s no obligation.

The best insurance for a healthy practice.

® Registered Marks Blue Cross and Blue Shield Association ® Registered Mark Blue Cross and Blue Shield of New Jersey, Inc.

New Jersey has eliminated one of the most costly inequities in our tort system... paying claimants twice for the same injury in many cases. Changing the "collateral source rule" has been a major priority of the Medical Inter-Insurance Exchange in its efforts to reform the medical malpractice legal system. The Exchange provided the initiative and leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. It will moderate the ever-increasing severity of insurance losses. A significant victory... but only one step in the Exchange's continuing battle to relieve physicians of unfair burdens.

Knowing what to look for...

Endorsed by
Medical Society of New Jersey

As a physician, you look for signs and symptoms in your patients to help you make accurate diagnoses. With your trained eye, you may make a prognosis based on events or conditions existing now.

So it is with investments. At AMA Advisers, Inc., we have the money management expertise to evaluate financial trends by carefully measuring symptoms in the market. We're the investment management organization interested in serving your investment needs with the full array of mutual funds in The AMA Group.

No matter what your investment strategy, we believe we can help you build an investment program to meet your financial goals. Plus, we offer a full range of investor services, including our Asset Investment Management (AIM) service,

and of course, overall professional management of the highest quality.

Knowing what to look for can make all the difference! Let AMA Advisers help you. Simply complete and mail the coupon for our FREE Information Kit on the funds in The AMA Group. We'll send you prospectuses with complete information detailing fees and expenses. Please read the prospectuses carefully before you invest or send money.

Services and products as described herein are not offered for sale in any state where they are not lawfully registered.

Women in Academic Medicine

ELIZABETH ALGER, MD
LAURIE A. BARROOD

It begins in medical school—the path to becoming a clinician, teacher, researcher, or administrator. As more women pursue medical careers, more are choosing and being chosen for positions of responsibility within the profession. And as women assume leadership roles, students have a diversity of models and mentors that their predecessors lacked.

What prompts women to go into academic medicine?

The answers to this question are diverse. Some like the flexibility, variety, and professional security that it offers. “Academia is the best of both worlds,” says Deborah Rosa, MD, a third-year surgical resident at UMDNJ–New Jersey Medical School.

Other physicians like the fact that academic medicine is not profit-driven, and find working with students and residents very rewarding.

A university’s supportive and creative environment provides professors with the opportunity to learn from colleagues. “Collegiality and the ability to share ideas and to discuss projects are just some of the advantages of being in academics,” says Betty Hammond, MD, an assistant professor in the Department of Family Medicine at UMDNJ–Robert Wood Johnson Medical School.

“The tradition of passing on knowledge and dealing with young people is very stimulating,” says Palma Formica, MD, newly elected president of the Medical Society of New Jersey and associate professor of Clinical Family Medicine at UMDNJ–Robert Wood Johnson Medical School. “I was disturbed by the lack of emphasis on the art of medicine being taught to students in medical school. It seemed like they were losing the caring aspect of medicine. I wanted to leave a legacy of values with them that I felt was important.”

“It is exciting to teach future practitioners what you’re doing. And having projects for them to participate in, makes learning exciting,” says Audrey Gotsch, DPH, associate professor and chief, Division of Consumer Health Education in the Department of Environmental and Community Medicine

at UMDNJ–Robert Wood Johnson Medical School.

A number of faculty members observe that teaching provides a stimulus to their own learning. “Students are enormously challenging because they may

Table. U.S. medical school graduates, 1960 to 1987, noting women and men graduates.

ask questions that require you to do research for an answer,” says Nancy Gary, MD, professor of medicine and executive associate dean at UMDNJ–Robert Wood Johnson Medical School.

Flexibility and research facilities are attractive qualities in academic medicine. Research provides indepth solutions to medical problems, in addition to publishing and advancement opportunities.

Patient care activities are very important components of academic medicine. The opportunity for physicians to practice and demonstrate clinical medicine is the essence of an academic medical center. The clinical facilities at UMDNJ provide patient care settings from primary care to highly sophisticated tertiary care.

Dr. Alger is Associate Dean for Education, UMDNJ–New Jersey Medical School, and Ms. Barrood is Senior News Service Assistant, UMDNJ, Office of Government and Public Affairs. Requests for reprints can be addressed to Ms. Barrood, UMDNJ, Administrative Complex, 30 Bergen Street, Room 121, Newark, NJ 07107.

Administrators have much broader responsibilities. They're not only professors or caregivers. They have a broader mission in shaping an institution. Women who assume administrative responsibilities achieve such positions after having distinguished themselves in one of the other areas.

As the numbers of women in medicine increase, more and more women will rise to positions of administrative responsibility within academic medical centers.

"[Senior administrators] at UMDNJ have been great supporters of women," says Gloria Bachmann,

GLORIA BACHMANN, MD

Figure 1. Gloria Bachmann, MD.

Choosing between pediatrics and obstetrics and gynecology was a difficult decision for **Gloria Bachmann, MD**. It wasn't until she assisted in the delivery of quadruplets that she was convinced obstetrics/gynecology was the specialty for her: "I was so overwhelmed during the birth of those four babies that I said, 'This is what I want to do.' It's such an exciting field."

Dr. Bachmann is associate professor in the Department of Obstetrics and Gynecology at UMDNJ-Robert Wood Johnson Medical School. She also is director of Middlesex Planned Parenthood, a clinical researcher, and a practicing physician.

A graduate of the University of Pennsylvania Medical School, Dr. Bachmann was the first woman to complete all four years of residency in obstetrics/gynecology at the Hospital of the University of Pennsylvania.

Much of her effort these days is spent on research. "I have a thirst for problem solving," Dr. Bachmann said. She currently is working on a two-part project, "Childhood and Adolescent Sexual Abuse and its Medical and Psychological Consequences in Adult Women." This includes a review of the world literature on sexual and physical abuse and a com-

MD, an associate professor in the Department of Obstetrics and Gynecology at UMDNJ-Robert Wood Johnson Medical School. "They have given women the opportunity to fulfill goals, and they have accepted women for their abilities and competence—not because they're male or female."

As the number of women entering medical school increases, the number of women faculty grow (Table). With this, the role of women in education will become more diversified. Interviews with five members of the faculty of UMDNJ show this diversity and the dedication of today's women physicians. ■

prehensive evaluation of over 600 women questioned on the subject.

Another area of continuing research interest for Dr. Bachmann is menopause, and the psychosocial health of women and their hormonal changes. These studies involve the emotional, sexual, and hormonal changes that occur at menopause, and are leading her to explore newer modalities of endocrine replacement therapy.

In addition to her research activities, Dr. Bachmann is chairman of the Women's Center Task Force, which is involved in updating, revising, and implementing new programs for women's health and, among other projects, is looking to establish a menopause clinic.

Dr. Bachmann finds academic medicine very challenging. "I can reach a lot more medical students this way and have an impact on the way they practice," she said. "One of my happiest moments at UMDNJ was when I received the Best Clinical Teacher award for 1986-1987 from the Family Practice residents. I felt so honored." Dr. Bachmann plans to continue teaching and instructing students in state-of-the-art health care for women. ■

NANCY GARY, MD

She has accomplished what some may think of as an eminent status, but to **Nancy Gary, MD**, there's still a lot more to come. Dr. Gary, a nephrologist, is professor of medicine and executive associate dean at UMDNJ-Robert Wood Johnson Medical School.

Currently on sabbatical, she is spending a year in Washington, D.C., as one of six Robert Wood Johnson health policy fellows in a program administered by the Institute of Medicine of the National Academy of Sciences, with assistance from the American Political Science Association. Designed for mid-career professionals, the purpose of the fellowship is to extend the public policy horizons of health professions schools, and improve the capabilities of their faculty members to study health policy and assume appropriate leadership roles in health activities at all levels. "It is an incredible opportunity.

It can't help but be an enormously enriching experience," said Dr. Gary.

Dr. Gary was both a clinical and research fellow at Georgetown University Hospital in the mid-1960s. "In 1965, nephrology was a new specialty. I was very interested in kidney dialysis." She continued, "There were only three fellowship programs in nephrology in the East. I applied and was accepted to all three. At Georgetown, I was the first and only woman in the program."

It was during that period that she considered a career in academic medicine. She loved to teach and take care of patients. "Academics was the right way to go," said Dr. Gary. "I could teach, do research, take care of patients, and work with people on the 'cutting edge' of science."

Dr. Gary joined the faculty of UMDNJ-Robert Wood Johnson Medical School in 1974 and assisted Dr. Robert P. Eisinger in establishing the Division of Nephrology. She was promoted to professor of medicine in 1981, and then was asked to become associate dean for academic affairs.

In her role as an administrator, Dr. Gary has been

Figure 2. Nancy Gary, MD.

instrumental in revising the undergraduate medical curriculum and has been responsible for strengthening relationships with affiliated hospitals and expanding clinical teaching sites. She also was involved in the development of programs to enhance recruitment of minority students, and spent the last year preparing information for the Liaison Commit-

tee on Medical Education for accreditation of UMDNJ-Robert Wood Johnson Medical School. ■

ELEANOR MASTERSON, DO

Figure 3. Eleanor Masterson, DO.

"If one student remembers something I taught him in order to save a life, my life as a teacher was well worth it," said **Eleanor Masterson, DO**, clinical associate professor of osteopathic sciences at UMDNJ-School of Osteopathic Medicine. A faculty member since 1979, Dr. Masterson received the 1986-1987 Excellence in Teaching award from the Foundation of UMDNJ.

When Dr. Masterson entered the Philadelphia College of Osteopathy in 1953, she was one of three women in a class of 105. "Some lecturers pretended not to see us until we proved ourselves. But I had a tremendous rapport with my classmates and I loved my teachers—especially those who expected the most," she said. Dr. Masterson fulfilled her own expectations of herself, graduating second in her class. "Today," she adds, "the barriers have disappeared and women are accepted for their abilities."

Dr. Masterson's entire career reflects her dedication to the teaching and practice of osteopathic medicine. She joined the faculty of her alma mater immediately after completing her internship, eventually holding associate professorships in three academic departments and serving as medical director of the clinics.

When the UMDNJ-School of Osteopathic Medicine was founded in Camden in 1978, she was invited to join the faculty and was named chief of the Osteopathic Science Department at Kennedy Memorial Hospitals-University Medical Center. Since then, she has remained active in undergraduate teaching and finds herself increasingly in demand as a spokesperson for her profession.

Eleanor Masterson always has been and always will be in academic medicine. "My aspirations haven't changed. I want to be the best teacher I can possibly be and pass on the best information." She continued, "I also want to be the best clinician I can be and provide the best care to my patients." ■

KAREN PUTTERMAN, MD

Figure 4. Karen Putterman, MD.

"Today, men and women are willing to admit that there can be more to the profession of medicine than taking care of patients, and it's all right to make use of your medical knowledge and training in other ways." **Karen Putterman, MD, MPH**, is acting vice-president for academic affairs at UMDNJ. Her career exemplifies the diversity of career opportunities available to her as a physician.

"I started out in pediatrics," said Dr. Putterman. "But, I had always been interested in public health because I could have a positive effect on a far greater number of people and even entire communities. I also found the epidemiologic and biostatistical aspects very stimulating intellectually."

JOYCE ROCKO, MD

Figure 5. Joyce Rocko, MD.

A novelty in 1972, **Joyce Rocko, MD**, was the only woman in the general surgery residency at Jersey City Medical Center. Dr. Rocko, a graduate of the University of Bologna, Italy, now is associate professor of general and vascular surgery at UMDNJ-New Jersey Medical School.

"I love surgery," said Dr. Rocko. "I went into trauma because I like the excitement. Trauma isn't 'cookbook'. You have to be your own genius."

Dr. Rocko finished her surgical training in 1976, having been chief resident in her final year. She remained on the staff of the Medical Center until 1981, when she was asked to become a full-time

In 1969, after completing an internship in pediatrics, Dr. Putterman entered a residency in public health and preventive medicine with the New York City Department of Health. In 1971, she was awarded a masters degree in public health from Columbia University.

In January 1987, Dr. Putterman left a career in the business world to enter the academic sphere at UMDNJ. As associate vice-president for academic affairs, she was responsible for education, research, and patient care issues at all six of the University's schools. Ten months later, when the senior vice-president accepted another position, Dr. Putterman was named acting vice-president. In this role, she participates in decisions about programs and policies that affect the University as a whole and works to coordinate academic activities among the schools. A new and exciting area for her involves enhancement of academic computing resources throughout the University.

Asked about her view of medicine as a career in the future, Dr. Putterman said: "I see a lot of opportunity for women and men in academic administration as well as the public health policy arena. These fields have become attractive for people with medical backgrounds who are attuned to what current society wants from the health professions." ■

faculty member at UMDNJ-New Jersey Medical School and director of Emergency/Trauma Services at University Hospital in Newark.

The switch to academic medicine was a rewarding one for Dr. Rocko. She has participated in a number of research studies on various aspects of trauma. She also has published and lectured on two topics of special interest to her: the management of portal hypertension and trauma in the pregnant patient.

Another reason she likes working in an academic setting is the opportunity to teach. "I love working with students and housestaff," Dr. Rocko said. "The residents are a challenge because they are always asking questions."

Dr. Rocko's interest in teaching extends well beyond UMDNJ. She has written several textbook chapters and she serves on the Continuing Education Committee of the American College of Surgeons (ACS). She is an author and editor of continuing education courses for trauma surgeons, and is the newly appointed medical coordinator of the Surgical Education and Self-Assessment Program of the ACS.

A valued member of many professional societies and University committees, Dr. Rocko plans to continue her career in academic medicine. "As long as there are trauma patients to care for, residents to teach, and the opportunity for research, I'll be happy," she said. ■

**The benefit of antianginal
protection plus safety...**

CARDIZEM: diltiazem HCl/Marion

A FULLER LIFE

A remarkable safety profile¹⁻⁶

The low incidence of side effects with Cardizem allows patients to feel better.

Protection against angina attacks^{1,5,7-9}

The predictable efficacy of Cardizem in stable exertional* and vasospastic angina allows patients to do more.

A decrease in myocardial oxygen demand

Resulting from a lowered heart rate-blood pressure product.⁵

Compatible with other antianginals⁶⁺

**Safe in angina with coexisting hypertension,
COPD, asthma, or PVD^{1,3,5,6}**

*CARDIZEM® (diltiazem HCl) is indicated in the treatment of angina pectoris due to coronary artery spasm and in the management of chronic stable angina (classic effort-associated angina) in patients who cannot tolerate therapy with beta-blockers and/or nitrates or who remain symptomatic despite adequate doses of these agents.

[†]See Warnings and Precautions.

CARDIZEM[®] ANTIANGINAL PROTECTION

diltiazem HCl/Marion PLUS SAFETY

Usual maintenance dosage range: 180-360 mg/day

BRIEF SUMMARY

Professional Use Information

CARDIZEM[®]

(diltiazem HCl)

30 mg, 60 mg, 90 mg, and 120 mg Tablets

CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, (3) patients with hypotension (less than 90 mm Hg systolic), and (4) patients who have demonstrated hypersensitivity to the drug.

WARNINGS

- Cardiac Conduction.** CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (six of 1,243 patients for 0.48%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.
- Congestive Heart Failure.** Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt). Experience with the use of CARDIZEM alone or in combination with beta-blockers in patients with impaired ventricular function is very limited. Caution should be exercised when using the drug in such patients.
- Hypotension.** Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.
- Acute Hepatic Injury.** In rare instances, significant elevations in enzymes such as alkaline phosphatase, LDH, SGOT, SGPT, and other phenomena consistent with acute hepatic injury have been noted. These reactions have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in most cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies, oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes; however, these changes were reversible with continued dosing.

Dermatological events (See ADVERSE REACTIONS section) may be transient and may disappear despite continued use of CARDIZEM. However, skin eruptions progressing to erythema multiforme and/or exfoliative dermatitis have also been infrequently reported. Should a dermatologic reaction persist, the drug should be discontinued.

Drug Interaction. Due to the potential for additive effects, caution and careful titration are warranted in patients receiving CARDIZEM concomitantly with any agents known to affect cardiac contractility and/or conduction. (See WARNINGS.)

Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

As with all drugs, care should be exercised when treating patients with multiple medications. CARDIZEM undergoes bio-

transformation by cytochrome P-450 mixed function oxidase. Coadministration of CARDIZEM with other agents which follow the same route of biotransformation may result in the competitive inhibition of metabolism. Dosages of similarly metabolized drugs, particularly those of low therapeutic ratio or in patients with renal and/or hepatic impairment, may require adjustment when starting or stopping concomitantly administered CARDIZEM to maintain optimum therapeutic blood levels.

Beta-blockers: Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated. Available data are not sufficient, however, to predict the effects of concomitant treatment, particularly in patients with left ventricular dysfunction or cardiac conduction abnormalities.

Administration of CARDIZEM (diltiazem hydrochloride) concomitantly with propranolol in five normal volunteers resulted in increased propranolol levels in all subjects and bioavailability of propranolol was increased approximately 50%. If combination therapy is initiated or withdrawn in conjunction with propranolol, an adjustment in the propranolol dose may be warranted. (See WARNINGS.)

Cimetidine: A study in six healthy volunteers has shown a significant increase in peak diltiazem plasma levels (58%) and area-under-the-curve (53%) after a one-week course of cimetidine at 1,200 mg per day and diltiazem 60 mg per day. Ranitidine produced smaller, nonsignificant increases. The effect may be mediated by cimetidine's known inhibition of hepatic cytochrome P-450, the enzyme system probably responsible for the first-pass metabolism of diltiazem. Patients currently receiving diltiazem therapy should be carefully monitored for a change in pharmacological effect when initiating and discontinuing therapy with cimetidine. An adjustment in the diltiazem dose may be warranted. (See WARNINGS.)

Digitalis: Administration of CARDIZEM with digoxin in 24 healthy male subjects increased plasma digoxin concentrations approximately 20%. Another investigator found no increase in digoxin levels in 12 patients with coronary artery disease. Since there have been conflicting results regarding the effect of digoxin levels, it is recommended that digoxin levels be monitored when initiating, adjusting, and discontinuing CARDIZEM therapy to avoid possible over- or under-digitalization. (See WARNINGS.)

Carcinogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in *in vitro* bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women; therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded.

In domestic placebo-controlled trials, the incidence of adverse reactions reported during CARDIZEM therapy was not greater

than that reported during placebo therapy.

The following represent occurrences observed in clinical studies which can be at least reasonably associated with the pharmacology of calcium influx inhibition. In many cases, the relationship to CARDIZEM has not been established. The most common occurrences as well as their frequency of presentation are: edema (2.4%), headache (2.1%), nausea (1.3%), dizziness (1.5%), rash (1.3%), asthenia (1.2%). In addition, the following events were reported infrequently (less than 1%):

Cardiovascular:	Angina, arrhythmia, AV block (first degree), AV block (second or third degree—see conduction warning), bradycardia, congestive heart failure, flushing, hypotension, palpitations, syncope.
Nervous System:	Amnesia, depression, gait abnormality, hallucinations, insomnia, nervousness, paresthesia, personality change, somnolence, tinnitus, tremor.
Gastrointestinal:	Anorexia, constipation, diarrhea, dyspepsia, dyspepsia, mild elevations of alkaline phosphatase, SGOT, SGPT, and LDH (see hepatic warnings), vomiting, weight increase.
Dermatologic:	Petechiae, pruritus, photosensitivity, urticaria.
Other:	Amblyopia, CPK elevation, dyspnea, epistaxis, eye irritation, hyperglycemia, nasal congestion, nocturia, osteoarthral pain, polyuria, sexual difficulties.

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme, and leukopenia. However, a definitive cause and effect between these events and CARDIZEM therapy is yet to be established.

Another patient benefit product from

Researching Women Physicians

BARBARA SMITH IRWIN, MLS

Very little has been written about the pioneering efforts, contributions, and careers of New Jersey women physicians. While three books have been published on New Jersey's medical history,¹⁻³ Rogers is the only one to include any reference to women physicians and an article by Cowen does not include women physicians.⁴

The purpose of this bibliographic essay is to provide an overview of the literature and to identify examples of library resources within the state for researching New Jersey women physicians as a stimulus to those who will write the history that has yet to be written.

LITERATURE OF WOMEN PHYSICIANS

The New Jersey Medical Women's Association (NJMWA), founded in 1924, is the first professional organization of the state's women physicians. In 1927, NJMWA joined the American Medical Women's Association (AMWA) and became known as "Branch Four." Current records are managed by the Academy of Medicine of New Jersey; some early reports and correspondence are on deposit at the Medical Archives of New York Hospital/Cornell Medical Center, New York City, among a collection of AMWA business records.

Other NJMWA activities can be traced in the *Journal of the American Medical Women's Association (JAMWA)* which began publishing in 1946 and was published briefly as *Woman Physician* from 1970 to 1971. The journal printed "History of Branch Four, New Jersey"⁵ and occasional biographies of outstanding members. NJMWA's history was updated in 1968, and published as a pamphlet.⁶ A newsletter was started in 1980 as *Physicienne* and continues on an irregular basis as *NJMWA News-*

letter. In 1986, NJMWA issued the first edition of a *Referral Directory* divided into two sections: membership roster and listing by specialty.⁷

"Women Physicians of New Jersey: The Early Era" appeared in 1984 in the *Journal of the Medical Society of New Jersey*.⁸ This article provides biographical sketches of 30 doctors from 1834 to the 1960s. This journal, now *NEW JERSEY MEDICINE*, is a key resource for articles about and by individual physicians; *Index Medicus* contains a cumulative index.

Essays on women physicians figure prominently in a forthcoming book. The Women's Project of New Jersey, Inc., a nonprofit organization, will publish *Past and Promise: The Heritage of New Jersey Women* in 1988.⁹ Editor-in-chief, Joan Burstyn, PhD, dean of the School of Education, Syracuse University and former chair of Rutgers University Women's Studies Department, states: "Three hundred women born as of 1923 have been selected for the book, including 26 New Jersey physicians and others who contributed to health sciences and nursing."

National reference sources providing biographical information for 19th century New Jersey women doctors include Lisabeth Holloway's *Medical Obituaries: American Physicians' Biographical Notices in Selected Journals Before 1907*,¹⁰ and *Notable American Women*.¹¹ Other useful sources include the American Medical Association (AMA) directories

Barbara Smith Irwin is Special Collections Librarian/Archivist, UMDNJ-University Libraries. Requests for reprints may be addressed to Ms. Irwin, G.F. Smith Library of the Health Sciences, 30 Twelfth Avenue, Newark, NJ 07103.

Figure 1. Cover of *The Healing Art* by Dr. Fred Rogers and A. Reasoner Sayre.

beginning in 1906 and continuing to the present. In 1979, AMA published the *Directory of Women Physicians in the U.S.*¹² Existing collections in nationwide repositories may be located in *Women's History Sources: A Guide to Archives and Manuscript Collections*.¹³ A monumental reference source of great value is *Women in Medicine: A Bibliography of the Literature on Women Physicians*; articles about and by women are identified in this work.¹⁴

Regional sources also are useful for identifying women doctors such as *Medical Register of New York, New Jersey, and Connecticut* (1862-1895). Studies of women's medical schools are valuable, as with *Send Us a Lady Physician*,¹⁵ because they may include students from New Jersey.

LIBRARY RESOURCES WITHIN NEW JERSEY

Six categories of libraries were selected for description: the state library, a medical school library,

an academic library, a private state historical library, a public library, and county/local historical institutions. While some collections in the first four categories are unique, the last two are representative of the types of materials which may exist in similar collections throughout the state.

New Jersey State Library (NJSL). The New Jersey Reference Division of NJSL contains a complete set of the *Board of Medical Examiners' Annual Reports* (1890 to 1954). Prior to the establishment of the State Board examinations, the only legal requirement to practice medicine in New Jersey was registration of a medical diploma with a county clerk. The Board reports list names of all physicians granted a license in the preceding year. Some reports also contain information on the physician's medical school, date of graduation, and residence. General information, such as the number of licenses granted to women, can be obtained through the reports; for example, in the period from October 1890 to Decem-

ber 1894, 19 women received licenses. During 1940, when the Board published its "Fiftieth Anniversary Report," 28 licenses were earned by women from a total of 240 tested: 16 for medicine and surgery, 6 for limited osteopathy, 4 for full osteopathy, and 2 for chiroprody.

The Jerseyana and Genealogy Collections of NJSL contain a wealth of resources for tracing individuals through their communities and families. One particularly useful source for locating birth, death, baptism, and marriage dates and places is *The Genealogical Magazine of New Jersey* with useful cumulative indexes prepared by

Kenn Stryker-Rodda. County and local histories also are available in the extensive Jerseyana collection.

The New Jersey State Library is located at 185 West State Street in Trenton.

University of Medicine and Dentistry of New Jersey—George F. Smith Library of the Health Sciences, Special Collections. The State's only New Jersey Medical History Collection is being developed at the Smith Library as a part of History of Medicine resources.

The University's History of Medicine Collection originated as the library of the Academy of Medicine of New Jersey which the Academy donated to the Smith Library. The gift included New Jersey historical materials, such as *New Jersey Medical Reporter* (1847-1858) and *Transactions of the Medical Society of New Jersey* (1766-1903). Also at the Smith Library are complete runs of the *Journal of the Medical Society of New Jersey* (1904 to present) and the *Membership Directory of the Medical Society of New Jersey* (1953 to present). In addition, there are newsletters, bulletins, and journals from many county medical societies where information on local activities of women physicians may be found.

Since designating the New Jersey Medical History Collection a priority area to be developed, the Smith Library actively has collected materials on women physicians. NJMWA and AMWA publications are available. There are biographical files for women physicians, both historical and contemporary. Other examples of resources include a videotape interview with Dr. Eva Brodtkin, first woman dermatologist in

Figure 2. The George F. Smith Library of the Health Sciences.

the state,¹⁶ and an oral history interview with Dr. Lena Edwards (1900-1986), a black physician who was nationally recognized for her dedication to improving medical care for the elderly and poor.¹⁷ There also is a scrapbook kept by Frances B. Tyson, MD (1874-1971), founder of the Leonia Youth Museum; her photograph portrait and other biographical materials are on file.

HISTLINE, the National Library of Medicine's online bibliographic database for the history of medicine, is one of the databases available at the Smith Library. The main collections contain *Index Medicus* and *Index Catalogue of the Library of the Surgeon General's Office* for searching articles by specific women physicians.

The UMDNJ-Smith Library is on the Newark Campus at 30 Twelfth Avenue.

Rutgers University Libraries-Alexander Library, Special Collections. An outstanding collection of New Jerseyana is contained in the Sinclair Collection, including extensive biographical directories. These directories are useful for locating information on prominent physicians in a specific community or county. One such example is a biographical sketch of Anna E. Griffith, MD, found in a southern New Jersey directory.¹⁸ The Rutgers' collection owes much to the efforts of Donald A. Sinclair, former curator, who acquired most of the directories during his tenure. Although retired from Rutgers, Sinclair has compiled a "New Jersey Biographical Index" as a companion volume to a bibliography of collective biographical sources. The latter still is in process, but Sinclair expects the index to

be published in the near future. Its significance as a reference tool for locating information on all physicians in New Jersey is apparent immediately; among sources indexed by Sinclair are biographical materials in the *Journal of the Medical Society of New Jersey* from the mid-1850s up to 1971, *Transactions of MSNJ*, 11 volumes of *Medical and Surgical Reporter*, and county medical society publications.

The Alexander Library is located on College Avenue in New Brunswick.

New Jersey Historical Society (NJHS). The Manuscript Collections of NJHS contain papers of Dr. Marietta H.C. Woodruff who graduated from New York Medical College for Women in 1874, including her case study of epilepsy conducted in 1908. Another Woodruff manuscript in the Society is a book of births, family information, and medical facts about the deliveries recorded by Dr. Woodruff from 1873 to 1900 in Boonton.

NJHS Manuscripts contain the archives of the Academy of Medicine of New Jersey (1775-1968). Among the papers in this group are records of other state and local medical organizations, such as the Physicians Club of Newark (1917-1924) and the Essex County Pathological and Anatomical Society (1962-1968).

NJHS has been designated the repository for the Women's Project of New Jersey archives when the book, *Past and Promise: The Heritage of New Jersey Women*, and a travelling exhibit have been completed; the records will consist of comprehensive files for all the women in the book and a card index of approximately 1,200 others considered for the project including physicians.

The NJHS Library contains a copy of *Report of the Association for the Advancement of the Medical Education of Women . . . 1878*.¹⁹ In addition, there are published histories of various county medical societies and family histories.

The New Jersey Historical Society Library is located at 230 Broadway in Newark.

Figure 3. Historical Society of Princeton.

The Joint Free Public Library of Morristown and Morris Township. Morris County is the focus of the Library's excellent local history and genealogy collection. Although the resources are unique for Morris County, they are representative of the types of materials which may be found in similar collections in other public libraries.

"The Curtiss Collection is one of our most precious resources," according to Lois Densky, archivist. "It consists of approximately 6,000 glass plate negatives and corresponding positive prints taken by a local commercial photographer from 1903 through 1938. There is an online computerized index for subject access." The collection includes many photographs of hospitals, hospital staffs, and health care.

Another example of a resource that local public libraries may have is a photographic album, such as one of Greystone Park in Morris Plains. Forty-six black-and-white photographs show the professional staff, administration, interiors, and exteriors of Greystone Park, a New Jersey psychiatric hospital.

Local history archives include a collection from the Morristown Memorial Hospital (ca. 1892-1981) with annual reports, Diamond Jubilee celebration material, and staff directories. A collection such as this provides documentation for women physicians affiliated with the hospital.

Gloucester County Historical Society (GCHS) and the Historical Society of Princeton (HSP). Libraries in county and local historical organizations are good resources. A researcher would more likely find a complete set of city directories in local repositories, such as GCHS. City directories, the predecessor of telephone books, are valuable sources through which physicians' offices and residences can be identified; the addresses are the keys to census records where there is still more data. State and U.S. census records on microfilm sometimes may be available in local repositories, but more often are found in the NJSL and larger institutions.

In addition to library and museum collections, historical societies often uncover unique materials while mounting exhibitions. Such was the case at the Historical Society of Princeton several years ago when an exhibit was being prepared on the community's medical history. An unpublished autobiography by Princeton's first pediatrician, Dr. Jeanette Munro, was located for the exhibit.²¹

Names and addresses of other historical societies may be located in *Historical Organizations in New Jersey: A Directory*.²² Listings identify library collections but do not provide information on types of materials. For information on manuscript collections, see *Historical Manuscripts: A Guide to Collections in the State*.²³

AN OUTSTANDING COLLECTION

Despite a wealth of documentation within New Jersey, recognition must also be given to a special library collection with resources that include New Jersey women doctors: The Medical College of Pennsylvania (MCP), Archives and Special Collections on Women in Medicine, 3000 Henry Avenue, Philadelphia, Pennsylvania. One of the most comprehensive collections in the United States on women physicians, the archives contain records of the school's predecessors, Female Medical College of Pennsylvania

and Women's Medical College of Pennsylvania.

Two types of materials are available in the collections: published articles and personal papers. The articles can be accessed through the bibliography *Women in Medicine*.¹⁴ Among New Jersey women whose personal papers are on deposit are Dr. Ellen C. Potter (1871-1958), the first woman to hold a position of cabinet officer in any state cabinet in the United States; and Dr. Mathilda Vaschak, who served as president of the New Jersey Industrial Medicine Association (1963-1964).

CONCLUSION

While little has been written about New Jersey women physicians, there are untapped resources awaiting researchers in a variety of libraries throughout the state. Selected holdings were described for statewide collections at the New Jersey State Library, UMDNJ-Smith Library, Rutgers-Alexander Library, and the New Jersey Historical Society. Representative holdings for public and county/local historical libraries were cited. One out-of-state collection at the Medical College of Pennsylvania in Philadelphia also was described. The history of women physicians in New Jersey deserves recognition. ■

Our First Woman Dermatologist

MORRIS H. SAFFRON, MD

Figure 1. Eva T. Brodtkin, MD.

© Eric Wagman Studio

fears. Eva entered Cornell University (her mother's choice) in 1916. Although enrolled as a premedical student, Eva managed to take many elective nonmedical, cultural courses as well as the prescribed scientific ones, and the pleasure in these lasted all her life. After graduation from Cornell in 1920, Eva began her professional studies at the Women's Medical College of Pennsylvania in Philadelphia. During her third year, she met her future husband, Harry Brodtkin of Newark, who was studying at the Jefferson Medical College. Their marriage lasted 60 years and was filled with mutual admiration and love for all the years spent together.

After graduation from medical school in 1924, Eva Brodtkin searched for a one-year rotating internship, required of all physicians before receiving a license to practice. Many hospitals still refused to accept women as interns, citing the difficulty of providing proper quarters. In spite of this, Dr. Brodtkin applied for and was accepted—as an “experiment”—at Muhlenberg Hospital in Plainfield. Wisely, she immediately decided not to rely on her femininity to avoid difficult tasks; instead she insisted on participating equally with the four male interns in riding

Morris H. Saffron, MD, is Archivist/Historian of the Medical Society of New Jersey and Visiting Professor of Medicine Emeritus, UMDNJ-New Jersey Medical School. Requests for reprints can be addressed to Dr. Saffron, 912 Fifth Avenue, New York, NY 10022.

On March 7, 1899, Eva T. Brodtkin was born in Brooklyn, New York, the daughter of Isidor and Theresa Tompkin. Isidor, just completing his medical studies at Long Island Medical College, set a pattern for the whole family, for two brothers also became physicians and a sister is said to have been the first woman graduate of the Brooklyn College of Pharmacy.

When Eva was only seven months old, her enterprising young father moved his small family to the village of Califon in Hunterdon County, where he was to carry on a country practice for 35 years. His daughter vividly recalls life in this rural setting, especially how the family would gather for breakfast at 5:30 A.M. to see father off on his long rounds in a horse and buggy.

It was at this early period of her life, also, that the young Eva became imbued with an *idée fixe* that she never lost; namely, that she would study medicine and assist her father, whom she adored. But educational facilities in rural areas then were primitive: eight elementary classes were taught in two modest rooms. Later, when she was sent to High Ridge High School (six miles away), transportation was so inadequate that she seldom returned home before 6 P.M.

MEDICAL EDUCATION

When the time arrived for deciding on a career, Eva found her parents very concerned about the problems confronting women in medicine, but her drive was so great she succeeded in calming their

ambulance and carrying patients on stretchers. By the time she finished her internship, Eva Brodtkin had received such high praise from staff and administrators of the hospital she felt she had broken down forever any resistance against female interns at Muhlenberg Hospital—and that was reward enough.

After her internship, Dr. Brodtkin entered general practice in Irvington, but soon moved to Newark where she shared office space with her husband. In Newark, her practice primarily was devoted to obstetrics; as a woman physician, she encountered the usual resistance from male and female patients.

After several years of general practice, interrupted only temporarily by the birth of two children, Eva and her husband decided a more specialized type of practice—one that would permit her to stay close to the office—would be more advantageous to the young mother. Eva chose dermatology—almost haphazardly—partially because it was one which did not require a residency.

DERMATOLOGY TRAINING

Eva then approached Dr. Henry J. Wallhauser, the veritable Nestor of New Jersey dermatology, for advice. Dr. Wallhauser was well-known for the famous Newark City Skin Clinic, which he supervised for 50 years; he also was consultant to 12 local hospitals, as well as being a prominent figure on the national scene. Dr. Wallhauser was a kindly man, and he became interested in the young lady who wished to enter his specialty. He tried to calm her fears about the prospects of a career in dermatology by telling her he too had similar fears in the 1880s when he consulted George Henry Fox, then the dean of New York dermatology.

Dr. Wallhauser invited Eva to attend skin clinics at the City and Beth Israel Hospitals. Through him she met Dr. Francis J. McCauley, Dr. Wallhauser's office associate, head of the skin clinic at Saint Barnabas Hospital. This was the beginning of a lengthy affiliation with that institution; eventually Eva succeeded Dr. McCauley on his retirement, remaining as attending dermatologist until her own retirement in 1964.

STUDY IN NEW YORK

In 1929, Dr. Brodtkin began ten years of study at the outstanding Skin and Cancer Hospital in New York, which was affiliated with the Postgraduate Medical School of Columbia University. For three years, Eva Brodtkin travelled to New York five days a week; it was only after she had received an appointment as Clinical Assistant at Postgraduate that she cut her attendance to three days a week—and this continued for the following seven years. During this period, she worked with Drs. Isador

Rosen, Max Scheer, Joseph J. Eler, and George Miller McKee.

At the end of this ten-year stint, Dr. Brodtkin felt sufficiently prepared to take the formidable examination of the American Board of Dermatology and Syphilology. Although she had been exempted from taking the written examination, she was subjected to a rigorous oral questioning by Dr. C. Guy Lane of Chicago, who then was Secretary of the Board. Only 50 percent of the applicants passed the examination; Dr. Brodtkin was successful and returned to New Jersey in triumph as the first qualified Board-certified dermatologist in the entire state.

DERMATOLOGIST

In 1939, Dr. Brodtkin was invited to join the Northern New Jersey Dermatological Society (later the New Jersey Dermatological Society), which had been founded in 1934 with Dr. Wallhauser as its first president; members included Dr. Bart James, and Dr. Francis McCauley, Dr. Eugene Miller, and Dr. Frederick Licks. During the ensuing decade, Eva Brodtkin played an increasingly important role in the activities of the Society, becoming its president in 1952 to 1953. A few years later, when the Medical Society of New Jersey formed a Section on Dermatology under the aegis of Dr. Emanuel M. Satulsky of Elizabeth, Eva Brodtkin again played an active part in it, planning the annual meetings in Atlantic City, and serving as secretary in 1959 and president in 1960.

OTHER INTERESTS

There still was another organization which played an important part in Dr. Brodtkin's way of life. During her internship she had met a kindred spirit, Dr. Clara DeHart Kraus, a Plainfield physician who had conceived the idea of forming a society of women practitioners of medicine in New Jersey. Dr. Kraus insisted on enrolling Eva as a member of the newly formed New Jersey Medical Women's Association (later affiliated with the National Medical Women's Association as Branch Four) by paying Eva's initial dues of \$2. Through the efforts of the Society's activists, more and more hospitals were encouraged to accept women as interns. In an article written by Drs. Brodtkin and Lydia B. Hauck, a psychologist, we learn how New Jersey women doctors cooperated with their colleagues in the New York Chapter in pressing for the passage of a bill to commission women physicians in the armed forces. (Others working on these problems who became friends of Dr. Brodtkin included Dr. Rita Finkler, the well-known endocrinologist, and Dr. Carye-Belle Henle, the first board-certified female radiologist in New Jersey.) During the war years, 1941 to 1943, Eva

Figure 2. Dr. Brodtkin was affiliated with Saint Barnabas Medical Center as an attending dermatologist until 1964.

Brodtkin served two consecutive terms as President of Branch Four, and was named Woman of the Year by the Association in 1964. She also was active in other nonmedical groups, including the League of Women Voters.

World War II brought changes into Eva Brodtkin's life. Her husband Harry, head of thoracic surgery at Beth Israel Hospital, was away on active duty for over five years, and the responsibility of raising their three children fell completely on Eva's shoulders. It was only on her husband's return, that they were able to resume their former extensive series of travels, which had taken them on safaris to Africa, Australia, Asia, and other remote areas.

RETIREMENT

In 1966, Eva Brodtkin decided to leave the office on Osborne Terrace in Newark which she had occupied for 40 years and move to Irvington. She shared office space with Dr. Jacob Bleiberg, with whom her son Roger then was associated.* By 1977, Eva's eyesight was beginning to fail and she closed her practice; also, her husband Harry's health was poor and he required his wife's constant care and devotion.

At 88 years of age, Eva Brodtkin resides in East Orange where she is very much the *grande dame* and the center of attraction for her three children, their

mates, and her seven grandchildren. Always an outspoken person with liberal ideas, she takes a stern view of the many changes in the practice of medicine that have taken place since her early days. Eva feels that the physician of today has lost the empathy with patients that dominated her own attitude. She is concerned with the problem of excessive charges for medical care, the burdens of malpractice insurance, and the needs of the impoverished who are not covered by medical insurance of any kind; and she feels that some form of governmental underwriting and control of universal medical care is inevitable—and, indeed, desirable.

Happily, Eva Brodtkin still retains all her faculties, including a voice which to this writer's knowledge has not changed its timbre in the past 50 years. For the future, consequently, all we can wish for this remarkable woman who had done so much for humanity, is good health *ad multos annos*. ■

CUMULATIVE INDEX

Princeton's First Pediatrician

JEANNETTE MUNRO, MD

Jeannette Munro was born in Philadelphia in 1894, but grew up in Madison, Wisconsin, where her father was Chairman of the University of Wisconsin History Department. She received her undergraduate degree from that institution in 1915; then after almost eight years as a social worker in New York City, she entered the Medical School of the University of Wisconsin, from which she received her medical degree in 1927. Because the school did not then have a hospital for training in clinical medicine, students went to Wisconsin and Chicago hospitals for periods of study and to La Crosse, Wisconsin, for preceptorships which would give them practical training and experience. After graduation, Dr. Munro spent a year in general internship at the Worcester Memorial Hospital in Worcester, Massachusetts, and two years as a pediatric intern at the Massachusetts General Hospital in Boston; she then set up practice in New York City. This was only marginally successful economically, so in 1933 Dr. Munro decided to move to Princeton, where her mother lived, and practice pediatrics in that city. She helped to found a Well-Baby Clinic and took part in other civic endeavors in Princeton and later in Hightstown, when she retired there. She remained active until her retirement at age 70. She died in 1986. The following excerpts are from Dr. Munro's unpublished autobiography.

People used to ask me, "Did you have a hard time getting into medical school?" No, I didn't because I set my sights reasonably and modestly. A friend of my mother's, Dorothy Reed Mendenhall, herself a graduate of Johns Hopkins Medical School, and one of the best known women doctors in the country, wanted me to challenge Harvard, then and for many years to come a completely male bastion, and already known as the finest medical school in the country. I was content to leave this effort to some brilliant woman aspirant of the future who might be counted on to outdistance all male competitors. I recognized at that time that I was not of that caliber. I felt that I would be welcomed at Madison and I was right. They took me entirely on my former record and I found myself enrolled without fanfare in the first four-year class of the University of Wisconsin Medical School. We were a small, but I think carefully chosen, class of six women and 19 men.

Medical school was from the first day a grueling experience, as it is now. Our course was divided into two years of pre-clinical work and two clinical years. Our pre-clinical courses had been given at Madison for some years but the clinical years had to wait for the establishment of a large general hospital which could eventually be expected to produce a rich supply of clinical material for practice and demonstration.

We were taught that a doctor was expected to work long hours, master tremendous amounts of material from new and unfamiliar fields, and always bob up cheerfully for more. In the first year we were plunged into the most fabulous task that anyone could imagine: we had to learn the name of every bone, joint, nerve, blood vessel, organ, and tissue in the human body. We dissected bodies in a cloud of formaldehyde and other unpleasant odors. I had the cadaver of a man who had died of peritonitis and I was resentful of the fact that dissection of the normal contents of the abdominal cavity was completely impossible.

Later on people would ask me, "Didn't you have an awful time getting established as a woman doctor, let alone a specialist?" I want to testify here that I expected to meet and did meet a certain amount of male chauvinism. However, taking it all-in-all, at Wisconsin and later in Princeton, I really got a fair deal from my male colleagues. I attribute this mainly to the essential good manners and kindness of the medical fraternity in both places.

This article contains excerpts from Dr. Munro's unpublished autobiography. Other sections have appeared in Princeton History 5:27-37, 1986. Requests for reprints can be addressed to Estelle Brodman, PhD, 19-09 Meadow Lakes, Hightstown, NJ 08520.

One thing we "hen medics" always had to face up to was the dirty story, the indescribably funny pornographic anecdote told in a group of men with the express aim of bringing a blush to the cheek of the one woman present. I always tried not to blush but not to laugh uproariously either.

CLINICAL YEARS

In medical school as we started on the real core of our medical course, the clinical years, we were introduced immediately to a universal reference book, a veritable bible for the medical students and the doctor in practice, known to us as "Osler." When you wanted to know any fact about any malady known to the human race, you just opened your Osler and there it was. The old master had been there before you, and he passed on to you in clear simple English, the history and characteristics of the disease, its pathology, the cause when known, the possible and probable complications, the prognosis, and what kind of treatment might help the patient. Treatment was the least satisfactory thing of these descriptions. There was a scant handful of maladies at that time for which there was any specific treatment available. We had salversan for syphilis and quinine from the "fever bark tree" for malaria. There were the recently developed antisera to fight diphtheria, meningococcus meningitis, and tetanus; cod liver oil to prevent and treat rickets; and finally insulin, the new specific which gave such wonderful promise for controlling diabetes. Controlling diabetes was just coming into its own; insulin had been isolated and we were learning how to use it.

To me, of course, the most important part of the clinical years was the pediatric course. Our textbook was the 1925 edition of Julius Hess's authoritative work, "The Care and Feeding of Infants." Hess was a splendid clinician and a revered teacher. In going through the book now I find many interesting features. There is a whole chapter on the wet nurse, and I can remember from my course lectures on the subject which stressed such factors as the position of the wet nurse in a home, how to keep her happy and therefore productive, and how to treat the child of the wet nurse. I never met up with a wet nurse in a home during my years of practice, but we could have used one at times.

In outlining the care of the premature infant, Hess described the use of a nasal spoon, which I never understood and actually never saw in practice. He also advocated the Breck feeder which I tried and found unsatisfactory. The simple medicine dropper usually worked better. Jackets for premature infants were made by nurses in those days. Layers of gauze were quilted over cotton batting to make a garment which covered every inch of the well-oiled infant

Figure 2. Dr. Jeanette Munro examining a patient in 1949.

except for a little circle for eyes, nose, and mouth. Hot water bottles were strategically placed. We certainly learned a whole new aspect of the premature infant, color, respirations, activity, when we first placed him naked in the isolette. Before the incubator was in use, when oxygen was needed, it was supplied through a face mask. We all know the tragic consequences that followed the first enthusiasm for free flowing oxygen in the early incubators: many infants whose lives were saved in the first incubators were later found to be blind because of the inhalation of too much oxygen.

Because the Madison hospital was very new and small it was necessary for us to go elsewhere for actual clinical training. Obstetrics and dermatology were handled in Chicago during our third year of medical school, and there was a preceptorship at La Crosse, Wisconsin, in the fourth year. In both instances my classmates and I were the first of our sex to take part in the program. In Chicago we all attended a lively prenatal clinic run by the hospital in a building near the settlement in which we lived. All first deliveries were done at the Chicago Lying-In Hospital but subsequent deliveries which promised to be normal were performed in the homes by teams of two students, supervised by a resident from the hospital.

On our team there always was a more experienced student and a novice, besides the very superior resident from the Lying-In Hospital. The less-experienced student carried to the home a large bag containing sterile sheets and instruments. We were never allowed to put this down in any street car or on any other surface except that, if we had a seat, we could hold it on a supposedly relatively clean lap. Otherwise the lowly assistant stood holding a swaying ring above her head with one hand and the bag just above the floor in the other. If the delivery did not appear imminent when we arrived we were left

by the resident-in-charge with provision for telephoning him in good time. Before we left the house we were supposed to fill out the birth certificate complete with the name of the newborn.

As part of our fourth year curriculum another woman classmate and I found ourselves joining the staff at a small hospital at La Crosse, Wisconsin. It was a first preceptorship—a first for the hospital and a first for us. We were there to get practical training and experience under skilled practitioners, and did we get it! We had not received our medical degrees, but were addressed as doctor and treated as such, in itself an exhilarating and sobering experience. We were interns in everything but name.

The clientele of the hospital was about 95 percent composed to old Norwegian farmers and their wives with their American children and grandchildren. When we followed Dr. Adolf Gundersen on his morning rounds we sometimes found that the whole procedure was conducted in Norwegian. The hospital had two large wards, for males and females respectively, and many double and several deluxe single rooms. These had private baths and were situated at corners assuring cross ventilation in the hot Wisconsin summers. These single rooms were expensive—\$5 a day. Relatives who wanted were allowed to stay with the patients in the single or double rooms.

We were the only interns at the hospital at the time, but there had been others, as witness the evidence of our quarters: we two women had a long narrow room off the medical staff sitting room. We ate with the resident staff—nurses, technicians, and office workers. The food was nondescript American boardinghouse food; later, when we took turns dining with the doctors on Sundays in their homes, we discovered the real Norwegian delicacies.

After dinner the first night we were plunged immediately into our new role. The youngest Dr. Gundersen introduced us to three patients who were to have gallbladder x-rays the next day. Each was to have an injection the night before and the young doctor demonstrated the technique on the first victim. Then, under his direction, we each in turn plunged a large syringe full of contrast medium into the elusive vein. Next evening there were four "gallbladders" waiting for us and we were alone. No one fainted, no one fell over dead. Already we began to get a certain confidence, even a feeling of developing skill. This was a good sample of the methods by which we were taught at La Crosse. We had no didactic lectures but lots of things to observe and procedures to follow. For the first time the responsibility of life and death was in our hands. The gist of the first lesson that first night was that you had to be tough and resolute if you wanted to become

a doctor. One lesson learned in those first days, and emphasized over and over in experiences in the wards, was that a doctor was willy nilly in a position of authority. The average patient looked up to us and expected us to assume responsibility.

INTERNSHIPS

After graduation there came for most of us a general internship of one year, and mine was spent at the Worcester Memorial Hospital in Worcester, Massachusetts. Women interns never were welcomed in most of the prestigious hospitals in those days, but this was a hospital that took only women. We came from all over the United States and one of us was from a Canadian medical school. We thus represented a wide variety of basic training; for example, giving ether had not been part of our course in Madison and I had to bone up on the subject with a great deal of help from my fellow interns.

In Worcester we had good solid fundamental training in medicine and surgery, and in obstetrics and gynecology, which to many of us was what medicine was all about; and we had excellent experience. Pediatrics was just a fringe affair which every general practitioner (GP) had to know something about, but we had no real pediatrician on our staff. We had children on the medical and surgical services and infants in obstetrics, of course, but no real pediatric service.

One facet of the life of the intern I resented at Worcester, and also later in Boston. We were housed and fed, but not particularly comfortably or well. We received not a cent of money, but were expected to work long hours, meet horrifying emergencies, and appear briskly and efficiently the next morning no matter how disturbed the night might have been. We had no regular time off, but made arrangements with our fellow residents to do double duty at times. We who came through were tough and resistant.

I realized in Worcester that to get any real pediatric training I would somehow have to get into a large teaching hospital. By pure luck I got my chance. Dr. Higgins from Cincinnati, I think, had been brought in to head pediatrics at the Massachusetts General Hospital (MGH) and he brought with him a woman assistant formerly at Wisconsin. She persuaded him to give me a chance. Even then I was not exactly of the same status as the male interns. The first year I had to live outside the hospital and the second year I was isolated in a nursing residence where I could not possibly get in on the evening discussions or informal sharing of the days' lessons.

I had to be at MGH by 9 A.M. and then the chief pediatric resident gave me an assignment for the day. I was in the clinic three mornings a week. On the other days I took histories of patients in the mornings, worked up their cases, and presented

them at pediatric grand rounds in the late mornings. In addition, we were supposed to supervise the care and feeding of the children in the surgical wards of MGH and also those in the ear, nose, and throat and ophthalmic wards.

I spent two years on the pediatric wards of MGH. There we saw many seriously ill infants and children. We had a small epidemic of meningococcus meningitis one year and my friend, the only other woman on the house staff at the hospital, died of it. We treated the disease by repeated lumbar punctures, sometimes as often as every eight hours, and the introduction of meningococcus antiserum into the spinal canal. The rule was to give 5 ml less than the amount of spinal fluid that had been withdrawn. There was a pitifully small number of cases that survived and most of them had residual neurologic defect. Subacute bacterial endocarditis was seen frequently; this of course was a uniformly fatal infection at that time, as were influenzal bacillary meningitis and tuberculosis meningitis.

During my time at MGH, Minot's discovery of the value of liver in pernicious anemia was just being publicized and of course we tried the liver treatment for all the severe anemias of childhood. All sorts of dainty liver dishes were concocted using cooked liver, and one inspired dietician even evolved liver ice cream.

We saw many children with pyuria. The treatment started with an attempt to wash out the kidney using mildly alkaline fluids in large amounts by mouth, the theory being that many bacteria did not thrive in an alkaline medium. If this did not work after about two weeks; there was then a switch to acid treatment. We used ammonium mandelate by mouth; fluids were restricted markedly. Any bacteria that could stand alkali were supposed to be completely routed by the acid treatment. And, strange to say, the method often worked and seemed to pay off.

Otitis media was a condition we were always meeting, and as pediatric interns, we were responsible for the general care and feeding of the children treated. The old time routine involved opening the ear drum widely at the first suggestion of bulging, and reopening it for better drainage, often repeatedly, if the temperature continued to be elevated. The ear canal was irrigated several times a day. In spite of this heroic treatment, we performed numerous mastoid operations and always had children with sinus thrombosis and brain abscess in the house for treatment and care.

We supervised feeding in a ward for children with gonorrheal conjunctivitis, with a population of approximately 20 newborn infants. Silver nitrate was used in the newborn's eyes in the hospital deliveries

Figure 3. The Princeton Hospital in 1938 where Dr. Munro practiced. (©The Medical Center at Princeton)

I wanted at least to keep in my field of choice, pediatrics. But there were no certified specialists in any brand of medicine then. Except in a few large medical centers, there were no doctors recognized as pediatricians. We were all GPs together, theoretically able to handle all medical problems as we met them. I had to take on anything in the medical field that I could get. All my volunteer work was in the clinic of the Babies Hospital, but the paid work I found available was a hodgepodge of

at that time, but evidently it was not a recognized legal must in the many home deliveries.

During my second year at the MGH I had a wonderful windfall. I was appointed to work one afternoon a week at a well-baby clinic in the neighborhood and was paid \$5 a session. I should really have paid for the privilege. It was my introduction to something very like private office practice and I learned a lot from the experience. I might note that the \$5 payment was a godsend. It was the only money I received for services in three years of postgraduate training, and \$5 was \$5 in those days. In later years I established a clinic in Princeton, based on that in which I had worked in East Boston, and later I started one in Hightstown when I retired there.

NEW YORK AND THE DEPRESSION

In the summer of 1930 I decided to launch my own practice in a city I knew and loved—New York. I had no career direction during my medical course and none during my postgraduate training. Certainly I knew nothing about the handling of medical practice as a business; I had always worked for a well-established institution and been paid a salary. My vague intention was to combine my two disciplines, social work and medicine, working for some such organization as the Children's Bureau or the New York City Health Department. I did not want to make money. I just wanted enough to live on comfortably while I engaged in very interesting work, but the literal down-to-earth position in 1930 was that the bottom was very shaky under the business of private medical practice. PhDs were selling apples on the street corners—why not MDs?

GP services. I examined girls and women who had signed up to use the YWCA pool, also others who wanted to work as waitresses at Schrafft's. I went over children bound for various "Fresh Air" camps. I was a paid worker in an evening clinic for working girls. But the sources of the largest dollops of cash was the work I did as stand-in for busier doctors. I made house calls all up and down Manhattan, day and night. Sometimes I was on call for five or six doctors, some of whom I did not even know. Some doctors filled me in on the history and paid in cash, but most just gave me a name and an address.

FINALLY: PEDIATRICIAN IN PRINCETON

In New York I was in the anomalous position of working as a GP while I wanted more and more to be a pediatrician, for which I had real specialty training. Then my father died suddenly, leaving my mother alone in Princeton. There was I, the unmarried daughter, who in the Victorian age would have been expected to give up everything to care for and cherish an ailing parent. I wasn't ready to give up my profession; but one of my successful and well-heeled women colleagues gave me a very knowing bit of advice. She told me I would never be recognized as a pediatrician unless I limited my practice to pediatrics, and I could not do that and survive in New York. She advised me to find a smaller place where a pediatrician was needed. There was the answer to the dilemma with my mother. I decided I would move to the highly literate small community of Princeton with its ambitious new hospital.

I must admit that no one in Princeton greeted my arrival as the answer to prayer. Our family doctor told me Princeton did not need, and would not sup-

port, a pediatrician—after all, there was a pediatrician in Trenton. Another Princeton doctor did not advise me not to come, but did suggest that I should not represent myself as a specialist and should never charge more than \$2 for an office visit or \$3 for a house call.

My office arrangements were quite elastic. I transferred my modest professional equipment to my mother's home, set up a makeshift office there, kept on my paid jobs and my Babies Hospital Clinic appointment, and commuted to New York while I tried out things in Princeton. Looking over 45 years, I know that sheer luck played a major part in the success I had in establishing myself as a pediatrician in Princeton. In the first place, it was luck that I was ready to tackle Princeton at the moment when the community was ripe for a pediatrician and when there was no charming and well-trained young man to challenge me in the pediatrics field. The second and prime piece of luck was that I fell heir to the position of doctor for the Princeton Nursery School—the equivalent of a first-class postgraduate course in private practice, which I needed desperately.

My previous training had all been in a hospital setting with its severe, life-threatening diseases, but with none of the common garden variety of sore throats, earaches, digestive troubles, or the common contagious diseases of children. Moreover, I had no experience in handling the behavior problems of normal healthy children, that take up about half of the pediatrician's time. I watched the nursery school workers with awe and admiration.

With my slowly growing practice I began to know and try to develop good relations with the medical group already active in Princeton. They were wary of me as the first woman doctor among them and also as a representative of that strange and threatening new breed, the medical specialist.

I worked in the Princeton Hospital; this had been started as a result of the flu epidemic of 1918 and originally could accommodate 22 patients under the care of the five GPs already active in the community. The building was inadequate in size, poorly planned and managed, crowded, a firetrap, and poorly ventilated. A new building was opened in 1928 and for many years I was the only pediatrician and the only woman on its staff. The hospital of that day had 56 beds and 12 bassinets, an operating room separate from the delivery room, and a 5-bed children's ward. There were only eight doctors on the staff, one nurse anesthetist, and one laboratory technician.

As the head of the tiny pediatrics department I was able to supervise conditions in our little ward, but only to a limited extent. But one thing about which I had some say in the Princeton community

was the routine immunization schedule as recommended for the well child: three double shots of pertussis vaccine somewhere between 6 and 8 months, three shots of diphtheria toxoid at 9, 10, and 11 months, smallpox vaccination at one year, and two shots of tetanus toxoid 3 months apart after the smallpox vaccination. No wonder they dreaded the doctor's office! During my early years of pediatric practice I had several patients die of pneumonia every winter, but not without a terrific struggle. Meticulous nursing care was all-important for survival in that era and I feel that the quality of the bedside nursing, in the day of 12-hour shifts for \$8 a shift, was extraordinarily high.

Many children's diseases which were rampant in the 1930s are seldom seen and not at all threatening today: diphtheria, scarlet fever, whooping cough, and measles, which came in waves every two to four years. Polio, the most dreaded of all, was a recurring nightmare. Mastoid operations were commonplace. Rheumatic fever was a long drawn-out recurring disease. Newborn babies died of Rh incompatibility in their parents; not even the doctors were aware of the diagnosis or treatment of the condition.

My work was in an exceptionally exciting and rewarding period in which to practice pediatrics. Year after year progress in diagnosis and the handling of cases were all about us. After the development of the various preventive shots, the next giant step in medicine was the coming of sulfa, penicillin, and the tetracyclines. The antibiotic era was in full swing. Then, after World War II came group practice, certification, and specialization. We had entered the modern age.

CONCLUSION

From the first day in my preceptorship at La Crosse I had been thrilled by the clinical side of the practice of medicine. To me the most fascinating aspect of the profession was that of a continuous learning process. I could never know all there was to learn about pediatrics as the volume of material on the subject was always being enriched, sometimes day by day. I learned from every case I saw and followed carefully, particularly from those where I had made a mistake or been stumped for a diagnosis. I read up avidly in the literature, textbooks, and periodicals. I attended lectures. I had formal and informal consultations with the most knowledgeable colleagues I could find. All-in-all it was a wonderful period of advancement in the pediatric field and in medical science in general. I still envy every young man or woman entering the profession and I still feel that the most satisfying life work anyone could ask for is that which I embraced on a spring evening over 50 years ago in La Crosse. ■

Limbitrol® [Ⓝ]

Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (See Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, dizziness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: **Cardiovascular:** Hypotension, hypertension, tachycardia, palpitation, myocardial infarction, arrhythmias, heart block, stroke. **Psychiatric:** Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. **Neurologic:** Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. **Anticholinergic:** Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. **Allergic:** Skin urticaria, photosensitization, edema of face and tongue, pruritus. **Hematologic:** Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. **Gastrointestinal:** Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, flatulence, tongue. **Endocrine:** Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Other:** Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

A Pioneer Endocrinologist

SYLVIA F. BECKER, MD

Figure 1. Dr. Finkler in a horse-and-buggy ambulance.

On May 3, 1915, a startling article appeared in the Philadelphia newspaper, *The North American*: it declared a Russian peasant girl had obtained a position as a resident physician at the Philadelphia Polyclinic Hospital—the first time that the institution had accepted a woman for this position: Rita S. Finkler, MD.

Hardly a peasant, Ricka Sapiro, born in 1888, was raised in the town of Kherson, Russia, in the Ukraine, the “breadbasket of Russia,” an area where wheat was the main product. Her father was an engineer in a flour mill. Her mother came from a family of scholars and had been sent to a private girls’ school for the study of music and art. Ricka was the third of five children, two of whom died at an early age. Fortunately for her, her father was an unusual man for those days, who believed strongly in the education of women. Ricka was sent to the local “gymnasium,” a combination of primary and high school, from which she was graduated with the highest honors, obtaining a gold medal for her scholarship. Ambitious to further her education, she ap-

plied to the University of St. Petersburg, and to everyone’s astonishment, was accepted. It was almost unheard of for a young woman of her background to be accepted at any Russian university.

This was a time of great unrest in Russia; several of Ricka’s aunts and uncles were imprisoned because of their political activities. Always idealistic, Ricka decided to study law, hoping later to come to the aid of political prisoners. So intense was her interest in these causes that later articles about her erroneously reported that she too had been imprisoned. This was not true; she completed her studies at the University, but quickly realized that as a lawyer under the Czarist regime, she could accomplish nothing of value. With the death of her mother, whom she loved dearly, and the subsequent remarriage of her father, she was unhappy at home.

Sylvia F. Becker, MD, is a gynecologist/endocrinologist, and daughter of Dr. Finkler. Requests for reprints can be addressed to Dr. Becker, 340 East Northfield Road, Livingston, NJ 07039.

Disappointed and disillusioned, she decided to leave Russia.

Alone and without funds, Ricka Sapiro worked her way through Turkey, France, and England; by 1910, she had saved enough money through her labors to pay for her passage to the United States.

In the United States, Ricka visited her uncle and his family in Philadelphia, and there she was introduced to another Russian, a student at the Woman's Medical College of Pennsylvania. Her new friend was enthusiastic about medicine and persuaded Ricka to apply for admission to the school. After obtaining and presenting her credentials from St. Petersburg University and taking some chemistry courses, Ricka was admitted to the medical school in 1911. Working as a seamstress (a skill she had learned while in France), she was able both to support herself and study medicine. Indeed, at the end of her first year, she won an award for excellence in anatomy and then was given a scholarship at the medical school.

While at the Woman's Medical College, she met and married Samuel J. Finkler, a chemistry student at Pennsylvania State College. She was graduated in 1915 with high standing in her class. The place of women in medicine still was very controversial; at the graduation ceremony, Dr. Richard Cabot of Harvard, to the shock of the graduates, denigrated the role of women in the medical profession. The great Dr. William Osler of Johns Hopkins had praised the Woman's Medical College of Pennsylvania and the quality of its graduates.^{1,2}

MEDICAL CAREER

It was not easy for women to obtain internships. The Philadelphia Polyclinic Hospital was no exception in its negative policy toward women interns. Dr. Finkler's high grades on the admission examination, plus the enthusiastic backing of the dean and faculty of the medical school, persuaded the governing body of the hospital to accept her. This event was so unusual that several Philadelphia newspapers placed it on their front pages.

At the Polyclinic Hospital, the male interns were unkind. They resented the young woman and heaped double the normal workload upon her hoping to force her resignation. Never a quitter or a complainer, Dr. Finkler worked to the point of exhaustion. Finally, the director of the laboratory, Dr. John Koller, a kind and sympathetic man who later became a pioneer in immunological research, noticed her fatigue. He became her protector, and saw to it that her workload was reduced to normal.

While serving her internship, Dr. Finkler rode in a horse-and-buggy ambulance, and the hospital used her picture in its local newspaper campaign for a motorized ambulance.

Figure 2. Dr. Finkler as she appeared in 1942; she was a staff member of Newark Beth Israel Medical Center.

After completing her training at Polyclinic Hospital, Dr. Finkler obtained a position in Philadelphia with a private organization, the Child Federation, which later became the Department of Child Hygiene. Much of her work was in slum neighborhoods of poor immigrants from Russia, Poland, and Italy. She quickly learned to communicate in Italian and Polish, and was soon known as "Dotoressa Italiana" among the Italian population.

Among these ethnic groups only midwives were used in childbirth, and it was Dr. Finkler's assignment to followup with examinations of the mothers and babies after the deliveries. She began to develop a small private practice in the evenings, consisting mainly of obstetrics and gynecology. Deliveries were only done in patients' homes, and often were performed under the most difficult of circumstances for the patient and physician.

About this time, Samuel had obtained a position in New York City, and was finding it very difficult to commute between Philadelphia and New York. One of his friends in Newark told Samuel that he and his physician-wife were about to move out of town. The medical practice was offered to Dr. Finkler, and she decided to accept the offer for the sake of her husband; in 1919 they moved to Newark.

The office, with accompanying residential quarters, was located on High Street, across from the old Beth Israel Hospital. Dr. Finkler obtained a position

in pediatrics at that institution, and she proceeded to practice pediatrics, obstetrics, and gynecology. Soon she had become an extremely busy obstetrician and gynecologist. In 1921, amidst all this activity, she found time to have a daughter, Sylvia.

ENDOCRINOLOGY

Always seeking to increase her skills, Dr. Finkler participated in courses at both the Post Graduate and the Mt. Sinai Hospitals in New York City. Her avid reading of American and foreign medical journals brought a new specialty to her attention—endocrinology. She became fascinated by the research being done in this field, especially in Austria and Germany. Determined to learn more about it, she travelled to Germany to study with Dr. Bernhard Zondek, who, with Dr. Selmar Aschheim, was becoming famous for introducing the first hormonal test for pregnancy. She also studied with Dr. Herman Zondek, Bernhard's cousin, then chief of medicine and endocrinology in another large institution in Berlin.

When she returned to Newark, Dr. Finkler began to duplicate the experiments she had learned abroad, establishing a small endocrine laboratory at the Newark Beth Israel Hospital—the first such laboratory in New Jersey. Besides doing experimental animal work there, Dr. Finkler and her assistants performed the still-new Aschheim-Zondek test for pregnancy in this laboratory, which was for many years the only New Jersey laboratory able to perform the test. She was given the title “Associate in Biology,” but her work was considered part of the department of obstetrics and gynecology.

The Beth Israel Endocrine Laboratory became well-known in New Jersey because of Dr. Finkler's frequent lectures and her scientific papers in standard medical journals. One of her first published papers was in the September 1930 *Journal of the Medical Society of New Jersey* and was entitled “Early Diagnosis of Pregnancy by the Aschheim-Zondek's Reaction.”³ Another clinical paper in the same journal followed in 1931: “The Female Sex Hormone.”⁴ In 1933, the same journal published another of her papers, “Recent Advances in Clinical Study of Endocrine Disturbances in Women.”⁵ As New Jersey physicians became more aware of the new specialty, they began to refer patients to Dr. Finkler's department for the diagnosis and therapy of endocrine conditions. During her lifetime, Dr.

Finkler published 67 papers in many prestigious scientific journals.

Because of the increased volume of work, an Endocrine Service was established at the Newark Beth Israel Hospital in the 1930s. Inpatient and outpatient facilities became available—the first and only such service in New Jersey at that time. Dr. Finkler felt that the endocrine facility should be independent of any other department, but this required she receive senior attending status. There was opposition at first from several male members of the staff to assigning this status to a woman, but, finally, in 1939, after a close election, she was appointed the first female attending chief of staff of the Newark Beth Israel Hospital and the Director of the first endocrine department in New Jersey.

INTERESTS AND HONORS

Among Dr. Finkler's other accomplishments was her help in establishing the New Jersey branch of the American Women's Medical Association; her enthusiasm helped transform this nucleus into a large, thriving organization throughout the state. In addition, she formed a journal club for women physicians, which met monthly to exchange scientific and practical ideas; the group was highly supportive of all women physicians. During World War II, Dr. Finkler was associated with The Committee To Aid Distressed Women Physicians, a group who organized a drive to rescue displaced women physicians in Europe during the war and assist them in establishing medical practices in the United States.

In 1956, the New Jersey branch of the American Medical Women's Association honored Dr. Finkler by naming her Woman of the Year. In 1965, the Medical Society of New Jersey marked the occasion of her 50th year in the practice of medicine by awarding her its Golden Merit Award. In 1967, the Woman's Medical College of Pennsylvania made her the recipient of its Alumnae Achievement Award. The Newark Beth Israel Medical Center memorialized Dr. Finkler in 1969 in the formal dedication of the Rita S. Finkler Endocrine Clinic. Subsequently, the doctor's study was adorned by a bronze bust of Dr. Finkler and also was dedicated to her.

Dr. Finkler died in 1968 at the age of 80. Dr. Rita Finkler's battle against prejudice towards women in medicine broke down many barriers and acted as an inspiring example to the many women physicians who followed her. ■

The World's Most Popular K*

Slow-K[®]
potassium chloride
slow-release tablets
8 mEq (600 mg)

It means "dependability" in almost any language

*Based on worldwide sales data on file, CIBA Pharmaceutical Company.
Capsule or tablet slow-release potassium chloride preparations should be reserved for patients who cannot tolerate, refuse to take, or have compliance problems with liquid or effervescent potassium preparations because of reports of intestinal and gastric ulceration and bleeding with slow-release KCl preparations.

Before prescribing, please consult Brief Prescribing Information on next page.

C I B A

The World's Most Popular K

For good reasons

- ❑ **It works**—a 12-year record of efficacy¹
- ❑ **It's safe**—unsurpassed by any other KCl tablet or capsule^{2*}
- ❑ **It's acceptable vs liquids**—greater palatability, fewer GI complaints, lower incidence of nausea²
- ❑ **It's comparable to 10 mEq**—in low-dosage supplementation^{3†}
- ❑ **It's economical**—less expensive than all other leading KCl slow-release supplements on a per tablet cost to the patient¹

Slow-K®
potassium chloride
slow-release tablets 8 mEq (600mg)

For patients who can't or won't tolerate liquid KCl.

*The most common adverse reactions to potassium salts are gastrointestinal side effects.

†Pooled mean serum potassium following oral administration of 30 mEq K-Tab compared to 24 mEq Slow-K in diuretic-treated hypertensives (n = 20) over 8 weeks.

Slow-K®
potassium chloride USP
Slow-Release Tablets
8 mEq (600 mg)

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE INSERT)

INDICATIONS AND USAGE
BECAUSE OF REPORTS OF INTESTINAL AND GASTRIC ULCERATION AND BLEEDING WITH SLOW-RELEASE POTASSIUM CHLORIDE PREPARATIONS, THESE DRUGS SHOULD BE RESERVED FOR THOSE PATIENTS WHO CANNOT TOLERATE OR REFUSE TO TAKE LIQUID OR EFFERESCENT POTASSIUM PREPARATIONS OR FOR PATIENTS IN WHOM THERE IS A PROBLEM OF COMPLIANCE WITH THESE PREPARATIONS.

1. For therapeutic use in patients with hypokalemia with or without metabolic alkalosis; in digitalis intoxication and in patients with hypokalemic familial periodic paralysis.
2. For prevention of potassium depletion when the dietary intake of potassium is inadequate in the following conditions: patients receiving digitalis and diuretics for congestive heart failure; hepatic cirrhosis with ascites; states of aldosterone excess with normal renal function; potassium-losing nephropathy; and certain diarrheal states.

3. The use of potassium salts in patients receiving diuretics for uncomplicated essential hypertension is often unnecessary when such patients have a normal dietary pattern. Serum potassium should be checked periodically, however, and if hypokalemia occurs, dietary supplementation with potassium-containing foods may be adequate to control mild cases. In more severe cases supplementation with potassium salts may be indicated.

CONTRAINDICATIONS

Potassium supplements are contraindicated in patients with hyperkalemia, since a further increase in serum potassium concentration in such patients can produce cardiac arrest. Hyperkalemia may complicate any of the following conditions: chronic renal failure, systemic acidosis such as diabetic acidosis, acute dehydration, extensive tissue breakdown as in severe burns, adrenal insufficiency, or the administration of a potassium-sparing diuretic (e.g., spironolactone, triamterene) (see OVERDOSAGE).

All solid dosage forms of potassium supplements are contraindicated in any patient in whom there is cause for arrest or delay in tablet passage through the gastrointestinal tract. In these instances, potassium supplementation should be with a liquid preparation. Wax-matrix potassium chloride preparations have produced esophageal ulceration in certain cardiac patients with esophageal compression due to an enlarged left atrium.

WARNINGS

Hyperkalemia (See OVERDOSAGE).

In patients with impaired mechanisms for excreting potassium, the administration of potassium salts can produce hyperkalemia and cardiac arrest. This occurs most commonly in patients given potassium by the intravenous route but may also occur in patients given potassium orally. Potentially fatal hyperkalemia can develop rapidly and be asymptomatic.

The use of potassium salts in patients with chronic renal disease, or any other condition which impairs potassium excretion, requires particularly careful monitoring of the serum potassium concentration and appropriate dosage adjustment.

Interaction With Potassium-Sparing Diuretics

Hypokalemia should not be treated by the concomitant administration of potassium salts and a potassium-sparing diuretic (e.g., spironolactone or triamterene), since the simultaneous administration of these agents can produce severe hyperkalemia.

Gastrointestinal Lesions

Potassium chloride tablets have produced stenotic and/or ulcerative lesions of the small bowel and deaths. These lesions are caused by a high localized concentration of potassium ion in the region of a rapidly dissolving tablet, which injures the bowel wall and thereby produces obstruction, hemorrhage, or perforation. Slow-K is a wax-matrix tablet formulated to provide a controlled rate of release of potassium chloride and thus to minimize the possibility of a high local concentration of potassium ion near the bowel wall. While the reported frequency of small-bowel lesions is much less with wax-matrix tablets (less than one per 100,000 patient-years) than with enteric-coated potassium chloride tablets (40-50 per 100,000 patient-years) cases associated with wax-matrix tablets have been reported both in foreign countries and in the United States. In addition, perhaps because the wax-matrix preparations are not enteric-coated and release potassium in the stomach, there have been reports of upper gastrointestinal bleeding associated with these products. The total number of gastrointestinal lesions remains approximately one per 100,000 patient-years. Slow-K should be discontinued immediately and the possibility of bowel obstruction or perforation considered if severe vomiting, abdominal pain, distention, or gastrointestinal bleeding occurs.

Metabolic Acidosis

Hypokalemia in patients with metabolic acidosis should be treated with an alkalinizing potassium salt such as potassium bicarbonate, potassium citrate, or potassium acetate.

PRECAUTIONS

General:

The diagnosis of potassium depletion is ordinarily made by demonstrating hypokalemia in a patient with a clinical history suggesting some cause for potassium depletion. In interpreting the serum potassium level, the physician should bear in mind that acute alkalosis *per se* can produce hypokalemia in the absence of a deficit in total body potassium, while acute acidosis *per se* can increase the serum potassium concentration into the normal range even in the presence of a reduced total body potassium.

Information for Patients:

Patients should consider reminding the patient of the following:

To take each dose without crushing, chewing, or sucking the tablets.
To take this medicine only as directed. This is especially important if the patient is also taking both diuretics and digitalis preparations.

To check with the physician if there is trouble swallowing tablets or if the tablets seem to stick in the throat.

To check with the doctor at once if tarry stools or other evidence of gastrointestinal bleeding is noticed.

Laboratory Tests

Regular serum potassium determinations are recommended. In addition, during the treatment of potassium depletion, careful attention should be paid to acid-base balance, other serum electrolyte levels, the electrocardiogram, and the clinical status of the patient, particularly in the presence of cardiac disease, renal disease, or acidosis.

Drug Interactions

Potassium-sparing diuretics: see WARNINGS.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies in animals have not been performed.

Pregnancy Category C

Animal reproduction studies have not been conducted with Slow-K. It is also not known whether Slow-K can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Slow-K should be given to a pregnant woman only if clearly needed.

Nursing Mothers

The normal potassium ion content of human milk is about 13 mEq/L. It is not known if Slow-K has an effect on this content. Caution should be exercised when Slow-K is administered to a nursing woman.

Pediatric Use

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

One of the most severe adverse effects is hyperkalemia (see CONTRAINDICATIONS, WARNINGS, and OVERDOSAGE). There also have been reports of upper and lower gastrointestinal conditions including obstruction, bleeding, ulceration, and perforation (see CONTRAINDICATIONS and WARNINGS); other factors known to be associated with such conditions were present in many of these patients.

The most common adverse reactions to oral potassium salts are nausea, vomiting, abdominal discomfort, and diarrhea. These symptoms are due to irritation of the gastrointestinal tract and are best managed by taking the dose with meals or reducing the dose.

Skin rash has been reported rarely.

OVERDOSAGE

The administration of oral potassium salts to persons with normal excretory mechanisms for potassium rarely causes serious hyperkalemia. However, if excretory mechanisms are impaired or if potassium is administered too rapidly intravenously, potentially fatal hyperkalemia can result (see CONTRAINDICATIONS and WARNINGS). It is important to recognize that hyperkalemia is usually asymptomatic and may be manifested only by an increased serum potassium concentration (6.5-8.0 mEq/L) and characteristic electrocardiographic changes (peaking of T waves, loss of P wave, depression of S-T segment, and prolongation of the Q-T interval). Late manifestations include muscle paralysis and cardiovascular collapse from cardiac arrest (9-12 mEq/L).

Treatment measures for hyperkalemia include the following: (1) elimination of foods and medications containing potassium and of potassium-sparing diuretics; (2) intravenous administration of 300-500 ml/hr of 10% dextrose solution containing 10-20 units of insulin per 1,000 ml; (3) correction of acidosis, if present, with intravenous sodium bicarbonate; (4) use of exchange resins, hemodialysis, or peritoneal dialysis.

In treating hyperkalemia in patients who have been stabilized on digitalis, too rapid a lowering of the serum potassium concentration can produce digitalis toxicity.

DOSE AND ADMINISTRATION

The usual dietary intake of potassium by the average adult is 40-80 mEq per day. Potassium depletion sufficient to cause hypokalemia usually requires the loss of 200 or more mEq of potassium from the total body store. Dosage must be adjusted to the individual needs of each patient but is typically in the range of 20 mEq per day for the prevention of hypokalemia to 40-100 mEq or more per day for the treatment of potassium depletion. Large numbers of tablets should be given in divided doses.

Note: Slow-K slow-release tablets must be swallowed whole and never crushed, chewed, or sucked.

HOW SUPPLIED

Tablets—600 mg of potassium chloride (equivalent to 8 mEq) round, buff colored, sugar-coated (imprinted Slow-K)

Bottles of 100 NDC 0083-0165-30

Bottles of 1000 NDC 0083-0165-40

Consumer Pack—One Unit

12 Bottles—100 tablets each NDC 0083-0165-65

Accu-Pak® Unit Ose (Blister pack)

Box of 100 (strips of 10) NDC 0083-0165-32

Do not store above 86°F (30°C). Protect from moisture. Protect from light.

Dispense in tight, light-resistant container (USP).

The Life of Lena Edwards

LINDA JANET HOLMES, MPA

Figure 1. Lena Frances Edwards. From Lena Edwards Collection, Moorland-Spangarn Research Center, Howard University, Washington, DC.

Lena Frances Edwards, MD, is an outstanding figure among black women and among New Jersey's early 20th century female medical practitioners. Her towering presence largely can be attributed to the fact that she constantly was unleashing her energetic spirit in community service and in active commitment to social values. As a woman, she was in the forefront on social issues as varied as increasing the need for day care to that of cancer prevention. As a physician she advocated preventive health care, natural childbirth, patient involvement in health work, and holistic medicine.

During her lifetime, Dr. Edwards received frequent recognition and praise; various awards recognized her contributions to medicine, race rela-

tions, community service, and religious organizations: Woman of the Year, 1954, from the New Jersey Chapter of the American Medical Woman's Association; the Edward J. Ill Award from the Academy of Medicine of New Jersey; the Bronze Medal from the Cancer Society; the Woman of Achievement Award from *Jersey Journal*; the Medal of Freedom from President Johnson in 1964; and the Howard University Meritorious Life Award in 1984.

Linda Janet Holmes, MPA, is affiliated with the New Jersey Department of Health. Requests for reprints may be addressed to Ms. Holmes, New Jersey Department of Health, Office of the Commissioner, CN 360, Trenton, NJ 08625.

Figure 2. President Johnson presenting Medal of Freedom Award to Lena Edwards, MD, 1964. From Lena Edwards Collection, Moorland-Spangarn Research Center, Howard University, Washington, DC.

BREAKING DOWN BARRIERS

As a black woman physician, Dr. Edwards was a trailblazer. When she began her practice in Jersey City in 1929, there already had been an established stream of black medical predecessors, both male and female, in the state and country. In fact, even during the slavery years, black doctors had practiced in this country and a black physician was known to have acquired a formal medical education as early as 1837.¹ Nevertheless, in the 1920s, when Dr. Edwards entered practice, there were a mere 65 black women physicians, according to the United States Census.² While Dr. Edwards certainly was not the first black female practitioner in the state, she was among the first black women in the entire nation to be Board certified as an obstetrician-gynecologist: in fact, there may have been only one other black woman Board certified before Dr. Edwards.³ She also was reported to be one of the first black women to gain admission to the International College of Surgeons. When fewer than 1 percent of the 5,000 members of the International College of Surgeons were female,³ Dr. Edwards was one of the earliest black female physicians to be elected to the College.⁴

In some ways, it is hard to envision the monumental nature of Dr. Edwards's accomplishments

compared to her actual physical appearance. She was small in stature, avoided high fashion, dressed plainly, and never wore makeup. For many years she wore her hair simply parted down the middle with pinned-up braids in the style of a schoolgirl. For Dr. Edwards, a treat of extravagance would be to sew fur on the collar of her suit.

Dr. Edwards also chose a personal lifestyle that was unembellished and uncomplicated. Much of her personal space was filled with expression of her deep religious devotion. Although she was a devout Catholic all her life, Dr. Edwards demonstrated how intense was her commitment to austerity when she took the voluntary vows of poverty and became a Lay Franciscan. When a pregnancy in her late childbearing years was plagued with medical complications, she vowed to attend mass daily. Blessed with a healthy outcome, she never violated her commitment to daily mass. Dr. Edwards maintained a home in Morris County for many years near a Catholic shrine, just for the purpose of family spiritual retreats. Apparently among her greatest personal joys were gardening and retreats that allowed time for appreciating nature.

EDUCATION

Lena was a high achiever. Similar to many other

middle-class black children, she attended Dunbar High School, the choice high school for black children in Washington, D.C. at that time, from which she graduated as class valedictorian. She attended Howard University and received her bachelor of science degree; immediately after graduation, Lena entered Howard University medical school and was the only female in her class that year.¹¹ Along with a medical education, Howard also provided the social environment for interaction with other expected achievers of her race. She married a classmate, John Madison, the day after graduation. Although Dr. Edwards's notions of childbearing and mothering responsibilities seemed to be highly congruent with the standard views of the Catholic Church, quite interestingly she never assumed her husband's surname but always remained Lena Frances Edwards.

ESTABLISHING A PRIVATE PRACTICE

After completing an internship at Freedman's Hospital in Washington, D.C., Dr. Edwards and her husband moved to the Lafayette section of Jersey City in 1925 to establish their respective medical practices. At a time when the schools in Washington, D.C. were segregated, their decision to move to Jersey City was partially motivated by their search for integrated parochial schools. Throughout her many years of medical and community service, Dr. Edwards would frequently crisscross racial and cultural categories in providing patient care and community service.

For a black woman, establishing a successful practice among white patients certainly was not the norm for the period; for the most part many early black female physicians were locked into providing care only for blacks who may have had limited financial resources. In this instance, the community in which Dr. Edwards worked was composed primarily of recently arrived Eastern European immigrants who were linked by their similar Roman Catholic backgrounds.

Among those families, Dr. Edwards soon developed her own "natural" set of clients. In the beginning, she and her husband literally shared the same office and waiting room space, alternating visits with patients. By the end of the first two years her husband had established a separate office in a neighboring house. Dr. Edwards said, "I guess my husband had more patients than I had at the beginning because it was hard for people to realize that this woman's a doctor. But fortunately I was in a neighborhood of the people from East Europe, like the Polish and the Slavish and what-not, and they were used to women, especially for maternity cases. They would come to me because they could talk freely to me. I built up a practice fairly well—very

well, as a matter of fact, in spite of the fact that I was having babies one behind the other."¹⁵

Despite the obvious intensity involved in establishing a medical practice and maintaining mothering responsibilities, Dr. Edwards extended herself into the arena of community service even in the early years. She often was called upon to speak at the YWCA and the local church on topics such as adolescent problems and even sex education. While always maintaining a broad-based humanitarian point of view, Dr. Edwards never failed to give special attention to the concerns of black people. In her very first year in Jersey City she organized a group of black college-educated women for the purpose of cultural exchange and to provide financial assistance and encouragement to young black women in college. Although the black women's club movement has a long history in this country, La Porte Cache, as it is called, was the first of its kind in Jersey City.⁶

By 1931, this lifelong pattern of integrating medical practice with community service and mothering was firmly established, but the opening of the Margaret Hague Maternity Hospital caused her professional life to shift dramatically. Until then, Dr. Edwards had attended the majority of the births at home, but with the opening of the Margaret Hague Maternity Hospital, her medical practice became concentrated in the hospital; moreover, the Hospital would provide opportunities for professional advancement. As a black woman, Dr. Edwards would find every professional advancing step challenged; but she remained steadfast and undaunted in her efforts to achieve. The strength gained from growing up in an environment where her independence was supported now would be tested; her deeply-rooted faith also would be challenged.

PERSEVERING IN THE PROFESSION

Dr. Edwards received an unsolicited appointment to the staff of obstetrics and gynecology at Margaret Hague Maternity Hospital. From the moment Dr. Edwards established a professional relationship with the Margaret Hague Maternity Hospital, it seemed that her gender, race, and inherent self-pride, drive, and refusal to take a posture of complacent acceptancy clashed with the empowered white male medical structure. She was in the hospital only a short period of time when she was told her presence on the staff was a problem. Nevertheless, she decided to pursue a residency in obstetrics and gynecology there; Dr. Edwards said that the critical moment in this decision actually came at a point of personal frustration when she believed that her inability to make decisions on medical management was compromising the welfare of her patients. "After that I decided I'm going to get a residency so I can

be assistant to the chief and determine myself what's going to happen to my patients."⁵ On repeated occasions her application was rejected. At one point it was suggested that she pursue a residency at New York's Harlem Hospital, but she continuously re-applied to Margaret Hague Hospital. In a fiery verbal protest in her usual blunt style, Dr. Edwards lashed out at the decision makers: "I've been coming here every year with my application to be a resident. I am now 44 years old, and I am going to keep on coming until I have to come in a wheelchair. You're not God, you know, and you can't tie my hands until you have given me the opportunity to use them."⁶ Finally, in 1945, she was accepted as a resident at the Margaret Hague Maternity Hospital.

For Dr. Edwards, the burdens of gender outweighed the handicaps of race; she was convinced that male opposition to females in any aspect of surgical practice would ultimately be more difficult to overcome than racial barriers. Perhaps she was far better equipped to withstand the expected racial prejudices as facts of life: issues of sexual discrimination may have received less formal attention when she was growing up than racial ones. In an interview in 1947 she discussed the problem: "Men resent women in surgery, and also in obstetrics because it is so close to surgery, so that it is still something of a handicap in obstetrics to be a woman—even today." She added, "In my case, racial barriers have arisen too, but I do not feel that being a Negro doctor has ever been so much a handicap as being a woman doctor."⁷

Dr. Edwards completed her residency in 1946, but again she faced resistance in her efforts to pursue the next logical step in the process of professional advancement: taking the National Boards in obstetrics and gynecology. After finally receiving the necessary endorsement to take the examination, she immediately was reminded upon entering the Shoreham Hotel in Washington, the site of the oral examination, that she was a black physician who was subject to the prevailing practices of segregation. She was ordered to take the service elevator. Not surprisingly, however, the always self-confident and persuasive Dr. Edwards convinced the elevator operator that she was entitled to the same elevator service as the other physicians. As a result of passing the Board examination, Dr. Edwards entered the annals of medical history as one of the first Board-certified black female obstetrician-gynecologists in the country. In 1953, she became a Fellow of the International College of Surgeons; moreover, in 1971 the U.S. Section of the College informed her that she would remain an active member without further dues commitments.

Even after becoming Board certified, Dr. Ed-

Figure 3. Dr. Edwards at a meeting of the International College of Surgeons. Dr. Edwards was one of the first women elected to the College. From Lena Edwards Collection, Moorland-Spingarn Research Center, Howard University, Washington, DC.

wards' struggles for full professional recognition within the Hospital were not over. A letter, apparently written while she was on call at the Hospital, but perhaps never sent, reflected the depths of her frustrations. Although she seldom chose to focus on frustrations, like others in similar situations, she sometimes grew weary:

For 25 years I have enjoyed a successful practice in Hudson County from the standpoint of patient-physician relationships and the privileges enjoyed at the medical center. But the greatest love that I have in my profession has been boiled down to the love of faithful, untiring service to my patients under the most humiliating and nerve-racking circumstances. But for the fact that I have a great respect for my pledge to the Oath of Hippocrates and an ardent desire to practice my profession as outlined in the Physician's Prayer, I would resign from the obstetrical staff and practice only gyn[sic]. The fact that I am a certified specialist who is trained in the specialty has made no difference in my status. I am the only certified obstetrician in the county without privileges in the Margaret Hague Maternity Center, albeit for three years I have met all qualifications except possibly race, sex, and age. There have been several appointments made while I have been consistently ignored. It is not my custom to beg for anything nor do I ask favors of anyone when it comes to my work. I know only the hard way, constant study, long hours, and efficient service.⁸

Ultimately, Dr. Edwards was appointed an Assistant Attending at the Margaret Hague Maternity Hospital; she remained there until 1954, when she

Figure 4. Dr. Edwards and friends from Margaret Hague Maternity Hospital. From Lena Edwards Collection, Moorland-Spingarn Research Center, Howard University, Washington, DC.

decided to spend some years teaching at Howard University in Washington, D.C. At her fated departure from Jersey City, it was reported she had delivered over 5,000 babies during her years of service in that community. Five years later, she went to Hereford, Texas, where she dedicated herself to work with Hispanic migrants and where she built a small maternity hospital. Dr. Edwards received the Medal of Freedom because of the personal sacrifice required and the achievements gained during her five years of mission work in Hereford.

FULFILLING THE MISSION

Throughout her life Dr. Edwards never grew tired of caring. During her senior years her work was characteristically vibrant. In fact, along with the wonder in the longevity of her work, there is an outstanding quality in the consistency of her work—never wavering from certain basic social values. As might be expected, as she grew older in no way did the frailties of her body defeat her; they only challenged her.

The final relinquishing of her medical practice did not seem particularly difficult. But even when Dr. Edwards ended her formal practice as a physician she never ceased offering advice about diet and exercise. She chastised those dependent on medications and was known as a physician who threw medicines out of a patient's window when she believed they were useless.⁹

In her last years, however, she was making plans to return to Jersey City to live, but those plans never materialized. Her daughter recalled, "She must have been on her way to the bathroom and just decided it was time to lay down and die. She didn't appear to have fallen. It rained the night before quite heavily, a major storm between 7 and 11 P.M. I called a number of times Tuesday during the evening, but didn't get an answer. I thought she was involved in one of her community activities. She always said she wanted to die with her boots on."¹⁰

And, indeed, when she died Lena Frances Edwards was still in the midst of doing so many of the things in which she fervently believed. ■

WE SCHEDULE LITHOTRIPSY FOR THE PATIENT'S CONVENIENCE AND YOURS.

The Mid-Atlantic Kidney Stone Center is proud of its prompt and convenient scheduling. Depending on the urgency of the situation, your patient will undergo lithotripsy treatment promptly, usually within one week of referral. In urgent cases, we combine evaluation and treatment on the same day.

In our nearly three years of practice as a lithotripsy service, we have treated more than 3000 patients, gaining the confidence of referring physicians in New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware.

Your relationship with

The Story of Sarah Mackintosh

GERALDINE HUTNER, MA

Figure 1. Sarah's final resting place.

Photo: Frank Cecala

On October 7, 1872, Sarah Fonda Mackintosh, MD, became the first woman member of the Passaic District Medical Society,¹ and eight months later, in June 1873, made further history by becoming the first woman inducted into a state medical society—the Medical Society of New Jersey, the oldest such society in the United States.²

BIOGRAPHY

Sarah Mackintosh, nee Apfonda, was born in New York City in January 1836 of a prominent and well-to-do family.³ Her father, a born-and-bred New Yorker, was a major in the Army; and her mother, though originally from New Hampshire, lived in New York for a number of years. Not much is known

about Sarah Apfonda's early years, until, at the age of 33, she entered the Woman's Medical College of the New York Infirmary at 128 Second Avenue in New York City.⁴

The Woman's Medical College of the New York Infirmary had been founded by Elizabeth Blackwell and her sister Emily in 1868 because, as Elizabeth put it, "The practice of medicine by women no longer is a doubtful, but a settled thing. But there is not in the whole extent of our country a single medical school where women can obtain a good medical education."⁴

Geraldine Hutner is the Managing Editor of NEW JERSEY MEDICINE. Requests for reprints should be addressed to Ms. Hutner, NEW JERSEY MEDICINE, Two Princess Road, Lawrenceville, NJ 08648.

Sarah Apfonda was one of nine students in the school's class of 1872. During her first year, she studied anatomy, physiology, materia medica, and chemistry; and there was practical work in pharmacy and in the anatomy rooms. In her second year there was additional class work in medicine, surgery, hygiene, and obstetrics. Small group bedside instruction, as well as a residency program at the school's Infirmary, also were available to second-year students. During their third year, students performed practical work and were expected to make case reports for their teachers. All students prepared a thesis paper as a final project for the degree of Doctor of Medicine; Sarah's topic was syphilis. When she had finished, Sarah received a diploma from the College Board of Examiners as well as her medical degree.

In 1870, before she graduated from medical school, Sarah married James Hetherington Mackintosh of Paterson, a pharmacist attending medical school at Bellevue Hospital Medical College in New York City, from which he received his medical degree in 1872. He had been born in England of Scottish parents and had emigrated to the United States in 1850; he became a citizen 33 years later. Sarah and James had three children: James Alexander (1872-1957); Sarah F. (1873-1956); and Lillith, who died in infancy.

In 1872, the Drs. Mackintosh started a practice together in Paterson and were speedily awarded membership in the Passaic District Medical Society. In 1875, they opened a private practice in a combined home/office at 136 Carroll Street; in 1886, they moved to 194 Carroll Street, where their office hours were 8:30-9:30 A.M.; 1-2 P.M.; and 6:30-8:30 P.M.⁵ In 1887, the Mackintosh family again relocated—to Asbury Park, where they bought a house/office at 515 Third Avenue. (At that time, living with them was Sarah's father-in-law, James F., a widower, who had come to the United States with his son in 1850; a house servant, Pinkie L. Jones, a single, 23-year-old black woman from Virginia; and daughter Sarah, who was unmarried and remained at home with her parents).^{6,7} Later, the family lived at West Fifth Avenue, at which place Sarah died in 1903.

Sarah joined the Monmouth County Medical Society soon after moving to Asbury Park; she also was affiliated with the Monmouth Medical Center about the same time, and remained an active staff member until her death.

Sarah Fonda Mackintosh, MD, died at home in Asbury Park on October 19, 1903, and was buried in the family plot in Cedarlawn Cemetery in Paterson.* Her tombstone reads "A true wife, a devoted mother, and a generous friend of the poor." Obituaries appeared in the *Asbury Park Journal* on

October 20, 1903, and October 30, 1903,^{3,8} and included the following statements:

Dr. Sarah Mackintosh, who died at her home on West Fifth Avenue yesterday, was probably one of the best known women in Asbury Park . . . [She] did many kind and graceful acts of charity. She was always ready to give when called upon and did a great deal for the poor people of this city and surrounding towns in a quiet and unostentatious way. Mrs. Mackintosh was loved and highly esteemed by everyone who knew her . . .

The later notice pointed out that "Dr. Sarah Mackintosh rated high in the medical profession" and emphasized that she had been the first woman member of the Passaic County Medical Society.

MEDICAL EDUCATION FOR WOMEN

Elizabeth Blackwell, who founded the medical school Sarah attended, was the first woman to receive a medical degree in the United States, which she obtained from Geneva College of Medicine in upstate New York under unusual circumstances. After studying with Dr. Joseph Warrington of Philadelphia, Elizabeth applied for admission to Geneva, an all-male school. The Dean felt the students would not tolerate the presence of a woman and so let them vote on Elizabeth's application. To his surprise, the student body voted to accept the request, stating "that the application of Elizabeth Blackwell to become a member of our class meets our entire approbation; and in extending our unanimous invitation we pledge ourselves that no conduct of ours shall cause her to regret her attendance at this institution."¹¹ Although the students did not live up to this pledge, Elizabeth persisted, and on January 23, 1894, duly received a degree of Doctor of Medicine.

Elizabeth Blackwell soon realized the need for a hospital in which women physicians could practice, and so with her physician-sister Emily, she helped to raise enough funds by 1857 to establish the New York Infirmary for Women and Children in New York City (now Beekman Hospital); 11 years later, with the approval of colleagues and workers, Elizabeth and Emily Blackwell fought to have the Infirmary's charter amended to allow it "to grant and confer the title of Doctor of Medicine."⁴ The Woman's Medical College of the New York Infirmary opened in November 1868 with a class of 17 students, 11 faculty members, and an 8-member Board of Examiners. The records stated, "A good general education was required for admission. Before receiving their diplomas, the candidates were asked to present a certificate from a clergyman, physician, or other responsible person, testifying to their moral character. A full year's course of lectures cost \$105,

Figure 2. Sarah Mackintosh's tombstone in Cedarlawn Cemetery.

(Photo: Frank Cecala)

plus \$5 for the Demonstrator's fee. Graduation fee was \$30 and a Matriculation ticket cost \$5."¹¹ The school had many eminent alumni and lasted until 1899, closing only when coeducation for medicine seemed assured.

There are no diaries or letters explaining Sarah Mackintosh's reasons for wanting to pursue a medical career, although we perhaps can assess her reasons by looking at the industrial and sociological changes taking place in 19th century America:

It was the social definition of woman's role in the 19th century that made more and more middle class women comfortable with the idea of studying medicine Women doctors belong to that group among 19th century women that historians have labeled domestic feminists. They viewed their campaign to study and practice medicine as part of a larger effort to adapt traditional concepts of womanhood to the demands of an unstable, complex, and rapidly

industrializing society. This redefinition explicitly called for a more intensive role within the family for all women and implicitly demanded a more comprehensive role for at least some women in society at large. Rarely did this early generation of women physicians challenge the cult of domesticity. They were genuinely comfortable with the concept of separate sexual spheres, because it allowed them to argue that women, by virtue of their special skills at nurturance, had a role in medicine that could compensate for, and be complimentary to, the role and achievements of men.⁹

Sarah Mackintosh probably was drawn to medicine as were other women; as a member of the middle class; moreover, she had the means to support herself and to reach her goal.^{9,12}

MEDICAL SOCIETIES

The need to join a medical society was as impor-

tant in the 19th and early 20th centuries as it is today. "It was in medical societies that physicians could meet to exchange information on medical ideas, techniques, and innovations. American medical societies were involved with medical licensing, setting professional standards, establishing fees, controlling schedules, and generally standardizing their profession. Through medical societies, physicians received case referrals and recommendations to hospital and other professional appointments. Indeed by the late 19th century, medical society membership was a virtual prerequisite for most hospital affiliations. . . . Membership in medical societies accorded its members status, economic and professional advantages, and consciously sought to establish inside and outside groups within the profession."⁹

In the 1850s, women began applying for membership in medical societies, specifically the Massachusetts State and the Philadelphia County Medical Societies, but were excluded from these organizations until the 1880s. The American Medical Association turned down all women applicants; female members were not admitted until 1915. Records show that Dr. Anna Lukens was admitted as a member of the Montgomery County, Pennsylvania, Medical Society in 1870, but not to the state medical society;^{9,12} hence, Sarah F. Mackintosh, MD, inducted into the Medical Society of New Jersey in 1873, was the first woman member of a state medical society in the United States.

In 1864, the revised bylaws of the Medical Society of New Jersey stated that all members must have completed training and passed an examination before applying to the District Society for membership,¹³ and it was under these rules that Sarah Mackintosh in 1872 applied for membership in the Passaic District Medical Society and was accepted. (This Society had been organized in 1844; by 1872, there were 28 members.) The minutes from the October 1872 meeting of the Passaic District Medical Society merely listed 5 new members, including Sarah and her husband James. The next year, in June 1873, Sarah's name was similarly added to the roll call of new members of the 397-member Medical Society of New Jersey—without any special recognitions or accolades upon becoming the first woman member of the Medical Society.

Dr. Mackintosh took her memberships in these societies seriously. If it seems unusual that she received no special recognition upon her acceptance in the fabric of the Medical Society, it is even more unusual that in 1874, soon after her induction, she presented a paper to the membership—the first woman to make a presentation¹⁴ to this all-male organization:

Chloral Hydrate in Labor

by Sarah F. Mackintosh, MD

Chloral hydrate, in the tedious first stage of labor, particularly in primipara, is a most valuable agent. From my own experience, in its use in the obstetric wards of the New York Infirmary, I am inclined to call it the most valuable agent we possess.

Given in 20 gram doses, it moderated the pain, hastens dilatation, and leaves the patient in so comfortable a state that she will frequently doze off between the pains, and, after delivery, almost immediately fall into a refreshing sleep. Without producing the complete insensibility which accompanies the use of chloroform or ether, and which is so often so alarming to ignorant attendants, and also without being supplemented by nausea or vomiting, it has, in ordinary cases, nearly all the advantages which attend the use of these anaesthetics.

As for my own practice, I never attend an obstetric case without carrying my chloral with me.

In 1876, Sarah Mackintosh became the County Reporter for the District Medical Society of Passaic. Reporters were expected to attend Annual Meetings, but Sarah was absent from the 1876 meeting. Instead she sent her communication¹⁵ with James, who was a delegate at the 110th Annual Meeting of the Medical Society of New Jersey in Congress Hall, Cape May City, May 23, 1876:

To Chairman of Standing Committee, &c.:

In accordance with your request, calling for opinions as to the value of topical remedies in malignant sore throat, and also to the cases in which calomel is considered the most beneficial, the reporter has sent notes to the different physicians composing our District Medical Society, to which but one, Dr. A.W. Rogers has responded [After this lengthy two-page report, Dr. Mackintosh continues:] During the past year Paterson has been visited by scarlatine and diphtheria, and by a few cases of variola; the latter, however, was pretty thoroughly isolated and quickly controlled.

Of diphtheria there have been many cases, with quite a large percentage of deaths. The treatment which in the hands of your reporter has been most successful, is that which is directed to the disease as a constitutional one entirely, and, as such, to be treated by *general* rather than *local*, remedies. Of these, the tincture of the chloride of iron and potassium chlorate, with stimulants and alimentation almost ad libitum, have appeared to yield the best results.

Scarlatine has presented about its usual variety of type; in some instances being so malignant as to overpower by its poison in a short time; in others so mild as scarcely to call for medicine at all.

In March and April, 1876, the epidemic of influenza which spread so extensively through the Middle States, prevailed to quite an extent here, but was generally more annoying than dangerous.

Our District Society is in a flourishing condition, numbering over 30 members.

Since the sending of the last report, our President, Dr. Orson Barnes, has been removed by death. After a lingering illness, he died July 23, 1875, in his 46th year, sincerely respected by his associates in the profession.

Over the next two years there were no reports from the Passaic District presented at the Medical Society's Annual Meeting. The report for 1879, written by Calvin Terriberry, MD, County Reporter, was six pages in length; in it he quotes Dr. Sarah Mackintosh on the use of pessaries in uterine displacements: "As palliatives, rendering the patient in some cases more comfortable, I have found them useful; as curative agents except in recent cases, the contrary."¹⁶

As soon as she was settled in Asbury Park, Dr. Mackintosh became a member of the Monmouth District Medical Society, which had been organized in June 1816. In 1888, when she joined it, there were 45 members in the District Society and 1,250 members in the State Society. Although she remained a member of the Monmouth County District until her death, there is no information on Sarah's contributions to it.

Sarah Mackintosh belonged to other societies. In 1878, she became a member of the Association for

the Advancement of Medical Education for Women; her name, along with that of Dr. Elizabeth Blackwell, appears on a report issued from a meeting of this group which took place in Union Hall, New York City.

In addition, Sarah was elected Secretary of Ladies Hospital in Paterson in 1873—one of four officers. Ladies Hospital, first known as The Hospital of the Ladies Association, was created in 1871 by the women of the Paterson Benevolent Society. A public institution, which became Paterson General Hospital in 1887 (and today Wayne General Hospital), opened to accommodate the growing need for hospital facilities in booming Paterson. The hospital was considered "a ladies enterprise, the ladies alone would have the management of it."^{17,18}

FINDINGS

Most of Sarah Apfonda Mackintosh's life is buried with her and her family and friends. Her personal feelings and emotions most likely will remain an enigma. What made her attend medical school and become a physician we may never know. It would appear, though, that she was a feminist in her own right, although, like many of the woman physicians both of her day and today, she combined the roles of wife and mother with the demanding role of physician. She was an active supporter of her family and medical community and gave of herself emotionally, financially, and socially. Her active role as a physician in Paterson and Asbury Park prove she was able to combine the traditional roles expected of 19th century women with the nontraditional role of doctor. Even more, Sarah Mackintosh, by finding her rightful place along her male colleagues in the Medical Society of New Jersey, was able to break ground for the women who came after her. By the time she died in 1903, there were over 20 women members of the Medical Society of New Jersey. ■

“He flourished during the first half of the 20th century.”

The American physician isn't extinct. But your freedom to practice *is* endangered. Increasing government intervention is threatening the quality of medicine – and your right to function as an independent professional. The government, responding to cost containment pressures from myriad sources, has taken a more active role in legislating reimbursement methods, payment levels and even access to care.

In your fight for survival, the American Medical Association is your best weapon. The AMA is the most influential force in health care. No other organization can so effectively reach the national policymakers who will help determine your future and the future of medicine.

Join the AMA. We're your voice in Washington. And we're fighting for you – and your patients.

For more information, call the AMA collect (312) 645-4783, or return this coupon to your state or county society.

DOCTORS' NOTEBOOK

Trustees' Minutes; UMDNJ Notes; Physicians Seeking Location in New Jersey

Trustees' Minutes March 20, 1988

A regular meeting of the Board of Trustees was held on March 20, 1988, at the Executive Offices in Lawrenceville. A detailed report is on file with the secretary of your county society. A summary of significant actions follows:

Report of the President . . .

1. Meeting and Conferences . . . Noted that Dr. Carnes attended nine meetings and conferences in February and March.

2. Occupational-Related Problems . . . Received notice that MSNJ will participate in a Department of Health program to identify individuals with occupational-related problems.

3. Legislative Update . . . Heard a legislative update from Clark Martin, MSNJ legislative representative, concerning: a mandatory assignment bill (A-2305); a public hearing to address mental health issues; Assembly passage of A-1591 (Licensing of Health Care Providers by Agency Action); the concept of licensing reform is being prepared in bill form; and, the Senate Committee on Institutions, Health, and Welfare will hear S-2091 (Conflict of Interest) requiring physicians to reveal whether they have a financial interest in any

type of service to which they refer patients.

4. JEMPAC Activities . . . Noted the following items of interest: Senator Frank Lautenberg and Pete Dawkins, Republican candidate for the U.S. Senate, were invited to attend the JEMPAC Wine and Cheese Reception at the Annual Meeting; JEMPAC will be represented at the 1988 Third Annual Republican Speaker's Dinner-Dance; and Assemblyman Chuck Hardwick will receive the AMNJ 1988 Citizen's Award to be presented at the Awards Dinner at the Chanticleer on May 25, 1988.

Commissioner of Health . . . Welcomed State Commissioner of Health, Molly Joel Coye, M.D., M.P.H., and Deputy Commissioner of Health, David Knowlton; Dr. Coye expressed her interest in learning the concerns of MSNJ and working to achieve a mutually acceptable resolution to issues.

Report of Executive Director . . .

1. MSNJ Paid Membership . . . Noted there are 6,107 paid memberships at the end of February 1988.

2. Glushakow versus Zavodnick . . . Noted that MSNJ filed an amicus brief in the appeal of this case, supporting the position of Dr. Glushakow; the case involved a guarantee for payment of physician's fee which was disregarded by the patient's attorney.

3. In re Brayshaw . . . Approved MSNJ's entering the case amicus, with the understanding that the defendants will be accorded the same rights as defendants in civil liability cases, namely: that they be entitled to complete discovery of that which the state possesses in terms of evidence; that they have the right to receive the reports of the state's expert witnesses; and that they have the right to depose those witnesses.

4. Emeritus Status . . . Voted unanimously to adopt the policy whereby age 65 is to be the normal retirement age for nomination to emeritus membership status. Also, directed that the Committee on Revision of Constitution and Bylaws also review the requirements for emeritus membership status and report back to the Board.

5. Federation of Licensing Boards Disciplinary Report . . . Received for information a copy of the Feder-

ation of Licensing Board summary of disciplinary actions reported for 1986 by state boards, and noted that the article reflected quite unfavorably on New Jersey.

UMDNJ . . .

1. Children's Hospital Proposed . . . Noted that a certificate of need is being sought for the location of a Children's Hospital on the Newark campus of UMDNJ.

2. "Top 25" Program . . . Received a report on the two-year study conducted by a national panel to meet the "Top 25" challenge of Governor Kean; two recommendations include reduction of tuition to one-quarter of its current sum and development of a scholarship program.

NJ Hospital Association . . .

1. Nursing Shortage Workplan . . . Noted that The Nursing Resource Center was inaugurated in February.

2. Medical Waste Disposal . . . Received information from Mr. Scibetta that a bill addressing the problem of medical waste is being drafted by Senator John Russo.

3. Reinsurance Association Surcharge . . . Was informed that the NJHA Board soon will develop an official posture on the issue of this surcharge.

4. Hospital Information Network . . . Noted that NJHA's Hospital Information Network has been sold to a Hospital Satellite Network in California.

MSNJ Auxiliary . . .

1. Continuing the Fight Against Drug Abuse . . . Approved the following resolution:

Resolved, that this principle of "no use of any illegal drug and no illegal use of any legal drug" shall be accepted by the American Medical Association Auxiliary in their quest for a drug-free society; and be it further

Resolved, that this principle be clearly communicated to our communities and families through educational programs, legislative actions, publications, and the use of the media on a national, state, and county level; and be it further

Resolved, that the state and county auxiliaries be encouraged to continue and revitalize programs and projects to promote drug awareness, education, and prevention; and be it further

Resolved, that these programs be undertaken with the approval of, and in coop-

eration with, the corresponding state and county medical societies/associations.

2. Auxiliary Support by Spouses . . . Carried the motion that physician members of MSNJ encourage spouses to become members of the MSNJ Auxiliary and to back its physician-focused activities.

Committee on Medicaid . . . Adopted the following position:

The Medical Society of New Jersey recognizes the Garden State Health Plan (GSHP) as a new, innovative, and potentially viable method of delivering quality health care to Medicaid recipients. The Medical Society appreciates the decision to implement the plan on a voluntary basis for patients and physicians.

In order to maximize the potential of the GSHP, and at the same time assure that Medicaid recipients (90 percent of whom will not be served by the GSHP format during the next three years) have access to quality health care, it is essential that simultaneous with implementation of the GSHP, the current physician fee schedule be increased to a minimum of 100 percent.

The government of the state of New Jersey must take notice that a 100 percent increase in physician fees will be the first recognizable adjustment in 18 years. At the same time, it still will produce reimbursement below that currently allowed by Medicare. This adjustment is necessary to prevent a service availability crisis in the Medicaid program.

Committee on Utilization Review Systems . . . Approved the following recommendation and directed the AMA Delegation to prepare a resolution for submission to the AMA House of Delegates in June:

That the Medical Society of New Jersey address the issue of socioeconomic hospital admissions, and that a solution be sought via legislative means.

Committee on Biomedical Ethics . . . Approved the following recommendation:

That MSNJ send a letter to the Commission on Legal and Ethical Problems in the Delivery of Health Care endorsing the concept of including the artificial administration of nutrition and hydration in the definition of life-sustaining treatment that can ethically be withdrawn from permanently comatose, vegetative patients.

Task Force on AIDS . . . Noted the organizational meeting of the Task Force on AIDS was held and topics

discussed included: policy on the testing of HIV positive patients, health care personnel who are HIV positive, and development of an AIDS program for the MSNJ Annual Meeting.

Committee on Senior Citizens . . . Noted the final report on the Senior Citizen Courtesy Program soon will be available and the April Senior Citizens Forum was cancelled because of a lack of registration.

Unfinished Business . . .

1. Verification of Financial Hardship . . . Filed a communication from the Morris County Medical Society advising MSNJ that any Morris County physician requesting exemption from the \$100 assessment should be granted the exemption.

2. Atlantic County Medical Society . . . Noted that the Tierno versus Atlantic County Medical Society lawsuit has been settled.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D.
President

UMDNJ's investment in "cutting-edge" medicine paid a dividend last month when University Hospital be-

came the site of the first known birth in the northeastern United States of a baby conceived with a donated egg. The New Jersey mother (who requested anonymity) and her baby girl are home and both are doing well.

The event, which gained widespread media attention, was the second major breakthrough recorded by our Center for Fertility and Reproductive Medicine, which is based at the hospital. Just a year ago, the Center announced its first pregnancy achieved via a donor egg.

In the recent case, the woman was unable to produce eggs of her own because of premature ovarian failure. The pregnancy was achieved by using another woman's ovum, or egg, and two innovative techniques originated at the Center.

The Center is one of the few institutions in the world with a successful egg donation program. There is no worldwide registry of pregnancies or births through egg donation, but the number is believed to be quite small.

The donor egg program is a form of in vitro fertilization (IVF), which has been used to produce babies for nearly a decade. Normally, the IVF procedure involves surgically remov-

ing the would-be mother's own eggs from her ovaries, fertilizing the eggs with her husband's sperm in a "test tube," and then placing the fertilized embryos into the woman's uterus. This procedure can be successful for women who have blocked or damaged fallopian tubes or who have endometriosis or a partner with low sperm count. But if a woman's ovaries do not produce eggs, she can become pregnant only through egg donation. Such a condition can occur due to premature ovarian failure; women born without ovaries; and women whose ovarian function has been destroyed by, for example, radiation therapy for cancer.

Six pregnancies of eight attempts have been achieved thus far. The Center's first successful implantation, and one other, ended in miscarriage; three other women still are pregnant. Miscarriage occurs in about 25 percent of all IVF pregnancies, and in 15 to 20 percent of all pregnancies.

The UMDNJ program only uses eggs from known donors and there is no exchange of money. Two innovative donor egg procedures are employed. One involves retrieving the egg from the donor without surgery by using a transvaginal ultrasound probe. In addition, to make the recipient's uterus have the right hormone levels to accept the fertilized egg, estrogen is supplied via patches applied to the skin. This latter methodology was designed by Dominique de Ziegler, M.D., of our faculty, who manages each egg donation cycle.

While ovulation is being stimulated in one woman, the other is receiving hormones to prepare her uterus for pregnancy. Instead of administering estrogen through pills—the procedure used in previous attempts—estrogen patches are applied to the skin to deliver a reliably measurable amount of the hormone to the blood. This procedure causes less nausea for the patient and bypasses the liver, which eliminates an unpredictable amount of estrogen when administered through pills.

The Center's egg retrieval technique is significant because, previously, general anesthesia was required to retrieve the donor eggs through an abdominal incision. The ultrasound probe enters through the vagina and the needle crosses the peritoneal cavity to reach the

ovary. The physician views the procedure on the ultrasound screen to guide the retrieval needle to the ovary to retrieve the eggs.

Actual fertilization of the donor egg takes place in the same in vitro manner as fertilizations using a woman's own egg. The usual technique is to transfer up to four embryos to increase the likelihood of pregnancy. Any remaining nonimplanted embryos are frozen for possible future transfer to the same patient.

The Center's team of specialists is led by Gerson Weiss, M.D., professor and chairman of obstetrics and gynecology at UMDNJ-New Jersey Medical School and Cecilia Schmidt, M.D., Center director.

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ALLERGY—Jerry Michael Shier, M.D., 11546 February Cir., Apt. 202, Silver Spring, MD 20904. UMDNJ 1982. Also, clinical immunology. Board eligible. Board certified (PED). Group, partnership, solo. Available July 1988.

ANESTHESIOLOGY—Kenneth Lum, M.D., 7240 Twin Eagle Lane, Fort Myers, FL 33912. Downstate 1985. Board eligible. Available.

Steven H. Ressler, M.D., 424 North Midland Ave., Saddlebrook, NJ 07662. Guadalajara 1982. Board eligible. Group or fee-for-service. Available July 1988.

CARDIOLOGY—Donald G. Rubenstein, M.D., 1037 3rd St., #303, Santa Monica, CA 90403. Louisiana 1980. Board eligible. Group or partnership. Available August 1988.

ENDOCRINOLOGY—Robert P. Castellucci, M.D., 3509 Kensington Ave., #3, Richmond, VA 23221. St. George's 1982. Board eligible. Partnership or group. Available September 1988.

Gerald B. Miele, M.D., 110 Fleet Pl., Mineola, NY 11501. Rush 1983. Also, internal medicine. Board eligible. Partnership, group, solo. Available July 1988.

FAMILY MEDICINE—Roy Berkowitz-Shelton, M.D., 132 Grove Pk., Ft. Dix,

NJ 08640. Georgetown 1981. Board certified. Partnership. Available.

Serge I. Kaftal, M.D., 30 South Auten Ave., Somerville, NJ 08876. Lodz (Poland) 1980. Board eligible. Solo, partnership, group. Available November 1988.

GASTROENTEROLOGY—Anil Agarwal, M.D., 18 Maltese Dr., Fair Lawn, NJ 07410. LLRM Medical (India) 1979. Also, internal medicine. Board eligible. Board certified (IM). Available July 1988.

David Rosenbock, M.D., 5 Riggs Pl., West Orange, NJ 07052. UMDNJ. Board eligible. Board certified (IM). Group, partnership, solo. Available July 1988.

INTERNAL MEDICINE—Anil Agarwal, M.D., 18 Maltese Dr., Fair Lawn, NJ 07410. LLRM Medical (India) 1979. Also, gastroenterology. Board certified. Available July 1988.

Paul R. Axelrad, M.D., 666 Ninth St., Lakewood, NJ 08701. St. George's University 1985. Methodist Hospital. Board eligible. Group or partnership. Available July 1988.

Marc Hanfling, D.O., 26 Glen Lane, Cherry Hill, NJ 08002. New York College 1981. Also, cardiology. Board certified. Board eligible (CARD). Group, partnership, solo. Available.

Peter Kuzmick, D.O., 62 Diamond Ave., Fort Rucker, AL 36362. Kansas City 1980. Board certified. Group or partnership. Available July 1988.

Gerald B. Miele, M.D., 110 Fleet Pl., Mineola, NY 11501. Rush 1983. Also, endocrinology. Board eligible. Partnership, group, solo. Available July 1988.

Edward C. Phillips, M.D., 24 Walnut St., Summit, NJ 07901. Downstate 1984. Board eligible. Group, partnership, solo. Available July 1988.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Board eligible. Board certified (PED). Also, pediatrics. Group, partnership, academic. Available October 1988.

PEDIATRICS—Linda York-Chance, M.D., 435 East 70th St., New York, NY 10021. Connecticut 1985. Board eligible. Clinic or emergency room. Available July 1988.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Also, internal medicine. Board certified. Board eligible (IM). Group, partnership, academic. Available October 1988.

PSYCHIATRY—Jozsef Telkes, M.D., c/o John Black, 3901 Crosswicks-Hamilton Square Rd., Robbinsville, NJ 08691. Pecs (Hungary) 1978. Board certified. Group or research. Available September 1988.

SURGERY—James H. Frost, M.D., 655 W. Irving Pk. Rd., Apt. 4306, Chicago, IL 60613. Guadalajara; Mt. Sinai Fifth Pathway 1983. Board eligible. Group or partnership. Available July 1988.

EXPECT YOUR NEXT PATIENT ON INDERAL[®] LA TO...

(PROPRANOLOL HCl)
LONG ACTING CAPSULES 60, 80, 120, 160 mg

MILLI

[illegible]

ON

...like the more than one million patients who have received **INDERAL® LA**.

In a recent survey, 4,120 participating physicians gave us their views¹ on **INDERAL LA** in the treatment of hypertension, angina and migraine.

INDERAL LA is their preferred beta blocker

...of the nearly three out of four physicians responding to the questionnaire, an impressive 97% rated **INDERAL LA** good to excellent for overall performance. Virtually all cited efficacy, tolerability, long-term cardiovascular protection and once-daily convenience as important factors in their choosing to prescribe **INDERAL LA**.

INDERAL LA promotes patient compliance

...Virtually every responding physician rated patient satisfaction with **INDERAL LA** to be as good as, or better than, other beta blockers.

Like conventional **INDERAL** Tablets, **INDERAL LA** should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree and bronchial asthma.

60 mg 80 mg 120 mg 160 mg

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION, SEE PACKAGE CIRCULAR.)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. INDERAL LA is formulated to provide a sustained release of propranolol hydrochloride. INDERAL LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. INDERAL is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by INDERAL, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

INDERAL LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with INDERAL LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of INDERAL Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

INDERAL LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to INDERAL LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, INDERAL LA has been therapeutically equivalent to the same mg dose of conventional INDERAL as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure, and rate pressure product. INDERAL LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. **Hypertension:** INDERAL LA is indicated in the management of hypertension; it may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. INDERAL LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: INDERAL LA is indicated for the long-term management of patients with angina pectoris.

Migraine: INDERAL LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: INDERAL LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. INDERAL LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. INDERAL is contraindicated in 1) cardiogenic shock; 2) sinus bradycardia and greater than first-degree block; 3) bronchial asthma; 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with INDERAL.

WARNINGS. **CARDIAC FAILURE:** Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or INDERAL should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of INDERAL therapy. Therefore, when discontinuance of INDERAL is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If INDERAL therapy is interrupted and exacerbation of angina occurs, it is usually advisable to reinstitute INDERAL therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema)—PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. INDERAL should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY: The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

INDERAL (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOLYCEMIA: Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS: Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 , and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. **GENERAL:** Propranolol should be used with caution in patients with impaired hepatic or renal function. INDERAL (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should be told that INDERAL may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS: Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS: Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if INDERAL (propranolol HCl) is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncopal attacks or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure, or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenytol, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Therophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY: Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY: Pregnancy Category C. INDERAL has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. INDERAL should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS: INDERAL is excreted in human milk. Caution should be exercised when INDERAL is administered to a nursing woman.

PEDIATRIC USE: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular: Bradycardia; congestive heart failure; intensification of AV block; hypotension; paresthesia of hands; thrombocytopenic purpura; arterial insufficiency, usually of the Raynaud type.

Central Nervous System: Light-headedness; mental depression manifested by insomnia, lassitude, weakness, fatigue; reversible mental depression progressing to catatonia; visual disturbances; hallucinations; vivid dreams; an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy, and vivid dream appear dose related.

Gastrointestinal: Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic: Paryngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory: Bronchospasm.

Hematologic: Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-Immune: In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous: Alopecia, LE-like reactions, psoriasisiform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (practolol) have not been associated with propranolol.

DOSAGE AND ADMINISTRATION. INDERAL LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from INDERAL Tablets to INDERAL LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. INDERAL LA should not be considered a simple mg-for-mg substitute for INDERAL. INDERAL LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION—Dosage must be individualized. The usual initial dosage is 80 mg INDERAL LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS—Dosage must be individualized. Starting with 80 mg INDERAL LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE—Dosage must be individualized. The initial oral dose is 80 mg INDERAL LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, INDERAL LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS—80-160 mg INDERAL LA once daily.

PEDIATRIC DOSAGE—At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

**Autologous Blood
Donation; DRG
Payment System**

**Autologous Blood
Donation**

February 28, 1988

Dear Doctor Krosnick:

During the past few years, patients have become uneasy about receiving another person's blood. Transfusing predeposited autologous blood is a safe and viable solution to this problem. Risks of disease transmission are eliminated, side effects are uncommon, and patients are willing to predonate. However, a recent study demonstrated the widespread underutilization of predeposited autologous blood.¹

We surveyed the surgery departments of nine New Jersey teaching hospitals concerning autologous donation. Hospitals included in the survey were Morristown Memorial Medical Center, UMDNJ-Robert Wood Johnson Hospital, Saint Barnabas Medical Center, The Medical Center at Princeton, Hackensack

Medical Center, Muhlenberg Regional Medical Center, Newark Beth Israel Medical Center, St. Michael's Medical Center, and the VA Medical Center in East Orange. A total of 425 surgeons were surveyed and 263 responded (61.9 percent). Fifty-one percent stated that their patient's medical condition often precluded donation, 42 percent stated that predonation usually was not possible because of late surgical referrals, and 31 percent stated that they were unaware of the American Association of Blood Banks (AABB) guidelines for predonation.

The AABB guidelines for autologous donation are similar to those for homologous donation. Most centers require a hemoglobin of at least 11 g/dl before each donation and criterion exclude no one based on age alone. Patients with a wide variety of medical conditions including heart disease, pregnancy, and advanced age have safely predonated. The donation period roughly is from 42 to 3 days preoperatively and most centers collect blood at weekly intervals.^{1,2} Side effects associated with predonating are anemia and hypovolemia. These can be minimized by the daily oral administration of ferrous sulfate 325 mg given three times a day during the donation period and for at least three months postoperatively.²

The predepositing of autologous blood before elective surgery is endorsed by the AABB.³ Programs are available nationwide and fully 50 percent of the AABB institutional members offers a program. As patients become more reluctant to receive homologous blood, autologous donation will become a more important part of total patient care. It is essential that all physicians become familiar with this form of blood donation.

DRG Payment System

January 19, 1988

Dear Doctor Krosnick:

Dr. Sapolsky's article, "An Evaluation of the New Jersey DRG Hospital Payment System," in the January 1988 issue of *NEW JERSEY MEDICINE* inspired a sense of déjà vu.

It simply is illusive to believe that industrial management techniques can be effectively applied to hospital cost accounting. Dr. Sapolsky is correct in concluding that hospitals "are more complex organizations than the DRG designers envisioned." In 1981, I co-authored an article in which we predicted that while the DRG program may be a salutary attempt to reduce the costs of the delivery of health care, strict compliance with the guidelines may indeed subject a hospital and a doctor to civil liability in a medical malpractice action (*J Med Soc NJ* 78:463, 1981).

In our article, I posited the omission of certain diagnostic tests on the grounds that they were unnecessary expense inconsistent with hospital policy of cost containment under the DRG program. In the article, which was designed to be a "think piece," I concluded that the hospital would be under liability for omission of the important diagnostic testing.

I bring this to your readership's attention now because I share the view in Dr. Sapolsky's article that while tighter DRG prices could save money, this might be perhaps at the cost of improvements in the quality of care.

I note from the editorial that the Medical Society of New Jersey is opposed to the DRG method of reimbursement. One of the reasons for this opposition, I submit, is the very real possibility of a diminution in sound patient care as a result of literal compliance.

ACUPUNCTURE & ELECTRO-THERAPEUTICS IN CLINICAL PRACTICE

NY State Boards of Medicine & Dentistry 25-hour accredited seminar & workshop on the latest theories & techniques of manual and electro-acupuncture, TENS & simple non-invasive diagnostic methods (including cardio-vascular & neuromuscular systems & "BI-Digital O-Ring Test"), applicable toward the 300-hour requirement for MD & DDS acupuncture certification, given for licensed clinicians (with/out prior training) the weekends of **May 13-15, June 17-19 and Dec. 9-11, 1988** at the Milford Plaza Hotel, 45th St. and 8th Avenue, Manhattan. The *4th International Symposium on Acupuncture & Electro-Therapeutics*, with many world leading scientists & clinicians will be held at the Columbia U Sch. of Int. Affairs, NYC, **Oct. 13-16, 1988**. Co-sponsored by the Int. College of Acupuncture & Electro-Therapeutics; Its official journal, *Acupuncture & Electro-Therapeutics, Res., Int. J.* (published by Pergamon Press, Indexed in 15 major indexing periodicals: Index Medicus, etc.); Heart Disease Research Foundation; Neuroscience Dept. & NY Pain Ctr., Long Island College Hospital; (SUNY-Brooklyn Health Science Ctr.); Nordic Medical Acupuncture Society; & Schmerz-Therapeutische-Kolloquium (W. Germany); etc. Also eligible for AMA/CME credit, category 1. For info on meetings or submission of papers, contact Y. Omura, MD, ScD, 800 Riverside Drive (8-I), NYC 10032. Tel: (212) 781-6262 or (212) 928-0658, or P. Shinnick, PhD, (212) 941-0870 or Mr. Spence (212) 866-8499.

Approved Acupuncture Program by NYSBM&D.

June 6-10, 1988 UPDATE YOUR MEDICINE 1988

Association of Practicing Physicians of The New York Hospital and Cornell University Medical College. 33 hours Category 1 credit, (39 if optional workshops taken). A one week review of all subspecialties of internal medicine. 9 major review symposia, 4 lectures, 10 workshops, 2 Meet the Professor luncheons, optional practice workshops in breast/pelvic and male genitoretal examinations. Held at The New York Hospital-Cornell, 1300 York Avenue at 69th Street, New York. Information: Office of CME, 212-472-6119. Dr. Lila A. Wallis is Course Director.

Jersey Shore Medical Center

ENDOCRINE SEASHORE SYMPOSIUM

BREAKERS HOTEL
SPRING LAKE, N.J.

THURSDAY, JUNE 2, 1988

A seminar for physicians emphasizing current diagnostic and treatment methods in Endocrinology. ANDROGEN EXCESS, ERECTILE DYSFUNCTION and DELIVERING ESTROGENS will be among the featured topics.

Contact the Department of Medicine, Jersey Shore Medical Center, Neptune, New Jersey 07753 for brochure. Telephone 776-4302.
COURSE FEE: \$35.00

(The Spring Lake Historical Society's Tour of Homes is scheduled on the same date.)

CHRONIC KILLERS: CARDIOVASCULAR DISEASE, HYPERTENSION & DIABETES

*An All-Day Symposium Cosponsored by the
Medical Society of New Jersey*

Wednesday, May 25, 1988 8 A.M.-3 P.M.
Quality Inn, Route 1 South, North Brunswick

Morning Speakers

Sylvia Herz, PhD
Molly Joel Coye, MD, MPH
William Tansey III, MD

FIVE DAY EMERGENCY MEDICINE BOARD REVIEW COURSE

Bellevue Hospital Center
Emergency Services

An intensive, five-day course providing:

- a concentrated review and update of Emergency Medicine topics
- analysis of relevant articles from the past six years of Emergency Medicine literature
- interaction regarding clinical controversies in management techniques
- sessions in written test-taking, and oral problem solving in ED medicine
- group sessions to assist participants with Oral Board preparation
- review of sample multiple choice questions with emphasis on test taking techniques
- special opportunity for 1 on 1 sessions with Board certified faculty to be provided on an ongoing basis throughout the course

TUITION: \$630

Accreditation: 38 AMA Category 1 credit hours / ACEP credit pending

For further information: NYU Post-Graduate Medical School,
550 First Avenue, New York, N.Y. 10016 (212) 340-5295

BOOK REVIEWS

Cardiology: A Clinical Approach; Clinical Endocrinology; Drug Treatment of the Rheumatic Diseases; Clinical Rheumatology Illustrated; 1987 Year Book of Hand Surgery; 1987 Year Book of Neurology and Neurosurgery; Walter B. Cannon. The Life and Times of a Young Scientist

Cardiology: A Clinical Approach. Second Edition

Ron J. Vanden Belt, M.D., James A. Ronan, Jr., M.D. Chicago, IL, Year Book Medical Publishers, Inc., 1987. Pp. 450.

The text provides a concise presentation of the pathology and physiological basis of clinical cardiology. This second edition has been updated to include new concepts regarding the understanding of normal heart function, physiology, pathology, and laboratory testing. It is a useful reference and is aimed primarily for medical students, residents, and others involved in the treatment of cardiac disorders. As a study manual, the authors have suggested that it may be comfortably read in portions over a four- to six-week period.

The contents are sectioned in a typical and orderly fashion and all relate to the field of cardiac diseases: history, physical examinations, laboratory tests, EKG findings, x-ray findings, and differential diagnoses. There are the sections on various cardiopathologies with discussions and descriptions of congenital heart, valvular and coronary diseases, hypertension, pulmonary function pathologies, and, finally, discussions and descriptions of the latest methods of cardiovascular surgical applications.

Each chapter is well illustrated and ends with a timely list of references. The manual is soft covered and has its merits as an easily carried and read study. It fills a gap: more detailed and larger than the jacket-pocket manual usually carried by the house staff physicians, but smaller and less detailed than the heavier hard-covered tomes. This text also would make a good study review for those preparing for their state or national boards in the field of cardiology.

Harry M. Poppick, M.D.

Clinical Endocrinology: An Illustrated Text

G. Michael Besser, M.D., and Andrew G. Cudworth, M.D., (eds). Philadelphia, PA, J.B. Lippincott Company, 1987. Pp. 275. (\$90)

This book covers most of the expected endocrine subjects except diabetes mellitus, but also includes chapters on hyperprolactinemia, endocrine hypertension, normal and abnormal sexual development and puberty, growth disorders, hypoglycemia and insulinomas, ectopic hormonal syndromes, radiology of endocrine disease, and neuroradiology of the pituitary and hypothalamus. The vast amount of knowledge utilized by the endocrinologist is rapidly and continuously increasing.

This text brings together endocrine physiology, histology, and diagnosis and therapy by employing numerous illustrations, photographs, tables, charts, and graphs. Many of these are in delightful color and are well organized as well as strategically placed within the text. This makes for clear understanding and learning, with retention of the subject presentation. Many radiographs including CAT scans (but no magnetic resonance images), with adjacent line diagrams, make for ease in reading and interpretation.

Most of the contributing authors are from the United Kingdom and, hence, we find more nmol/l and some less recognized medications. Welcome is the frequent comparison of the normal with the abnormal and the discussions combining the theoretical with the practical.

The text contains a great deal of endocrine information clearly brought together for ease of understanding, learning, and retention;

this book is recommended both for the novice and the clinician.

Mark M. Singer, M.D.

Drug Treatment of the Rheumatic Diseases, Third Edition

F. Dudley Hart (ed). Baltimore, MD, Williams & Wilkins, 1987. Pp. 229. (\$48)

Clinical Rheumatology Illustrated

F. Dudley Hart (ed). Baltimore, MD, Williams & Wilkins, 1987. Pp. 409. (\$80)

The first of these books is a well-written treatise on the pharmacologic aspects of the treatment of rheumatic diseases. It has two sections: the first section describes the pharmacological properties and side effects of all drugs used currently in rheumatology, and the second part discusses the practical treatment of some of the more common rheumatic diseases. However, I cannot recommend it to our readership in New Jersey since many of the drugs discussed are not available in the United States. This would be particularly confusing to nonrheumatologists who have enough difficulty attempting to recall all of the present anti-rheumatic drugs that are used.

In the second book, the author states one picture is worth a thousand words and he hopes that the many illustrations in this publication will be helpful. The problem with the book is that it is not a textbook nor an atlas: The color photographs are excellent but they are too few and far between. The black-and-white photographs are not all that helpful. The diagrams are good but, once again, they are too few. The radiographs are just fair with poor captions and no arrows to point out the pathology they describe.

As usual in a multiauthored text, I did find a couple of chapters written with clarity; some chapters were very educational, including one on the arthritic foot and one on the painful shoulder. I found the text incomplete with occasional glaring errors as in the chapter on systemic lupus erythematosus where it is stated that azathioprine (Imuran®) is relatively safe in pregnancy. Overall, I do not recommend it for a physician's library or even as a reference text. The *Atlas of Clinical Rheuma-*

tology would make a much better reference book, and lives up to the Chinese proverb, "A picture is worth a thousand words."

Sheldon D. Solomon, M.D.

1987 Year Book of Hand Surgery

James H. Dobyns, M.D., (ed). Chicago, IL, Year Book Medical Publishers, Inc, 1987. Pp. 330.

Doctors Dobyns, Chase, and Amadio again have done a wonderful job in editing the 1987 Year Book of Hand Surgery.

The book is very well organized; it is divided into 18 different chapters focusing on diagnosis and evaluation; different types of trauma and reconstruction; compression neuropathies; pain and vascular dysfunction syndromes; infection; occupational and avocational stress; arthritis; Kienböck's disease; tumors; congenital and pediatric problems; microsurgery; basic sciences; and research in hand surgery.

Each chapter has pertinent articles gleaned from 41 different journals. Each article has been summarized succinctly with a following critique pointing out the crux of the article and its weaknesses along with possible future ramifications in the field of hand surgery.

The book provides an excellent review of the recent literature in hand surgery for those who are hand surgeons and for those who maintain an interest in hand problems.

Harlan E. Hiramoto, M.D.

1987 Year Book of Neurology and Neurosurgery

Russel N. DeJohn, M.D., Robert D. Currier, M.D., Robert M. Crowell, M.D., (eds). Chicago, IL, Year Book Medical Publishers, Inc., 1987. Pp. 495.

This book, 34th in the annual

series from Year Book, has been "published without interruption since 1902," according to the title page. Until 1970, the text covered neurology, neurosurgery, and psychiatry. The knowledge explosion responsible for splitting the book into two separate volumes that year may well necessitate a further separation by the turn of the century if not sooner.

Half of the present edition is devoted to each of the two specialties. Each section is subdivided into the major topics within that specialty. For each topic, the editors have selected from the general literature several articles which they present in abstract form and follow with a commentary.

The commentaries generally are thoughtful and occasionally witty. Dr. Crowell, the neurosurgeon, tends to comment at greater length and more analytically. Each editor reveals his biases in his selections and comments, and no reviewers' opinions will coincide. Both the choices and the critiques, however, are fair.

The resulting overview of the literature is appropriately geared to clinical application. The researcher will be better served by the original articles in his own corner.

Clement H. Kreider, Jr., M.D.

Walter B. Cannon. The Life and Times of a Young Scientist

Saul Benison, A. Clifford Barger, Elin L. Wolfe. Cambridge, MA, Belknap Press of Harvard University Press, 1987. Pp. 520. Illustrated. (\$30)

A medical historian, a physiologist, and an archivist combined their considerable talents to produce a remarkable book that deftly integrates the biography of an eminent American physiologist with a detailed history of medical educa-

tion at Harvard University. Social historians undoubtedly will focus on the "times." I truly was captivated by the "life."

What a wonderful coincidence that Cannon was born in Prairie du Chien, Wisconsin, where 40 years earlier William Beaumont made some of his classic observations on gastric function, because Cannon also distinguished himself through his work on the physiology of the digestive tract. Cannon's ingenious use of x-rays and bismuth to investigate a wide range of subjects, from the mechanics of swallowing to the effects of emotion on gastrointestinal motility, were summarized in *The Mechanical Factors of Digestion* (1911), a book that still is an intellectual treat.

Always concerned about the clinical applications of his work, Cannon collaborated with John B. Blake in a series of experiments that showed that pyloroplasty was preferable to gastroenterostomy in treating non-malignant pyloric stenosis. Many notable surgeons, such as William Mayo, acclaimed the implications that this research had for their profession.

Influenced by one of his Ph.D. students, Cannon shifted his interests to endocrinology; this led subsequently to his classic studies on the role of emotion, e.g. fear and rage, in the secretion of adrenaline. He hypothesized that in emergencies, the adrenal medulla functioned to prepare the body for fight or flight. Although other prominent men had dissenting views, the issue was eventually resolved in Cannon's favor.

The book ends with Walter B. Cannon, at age 45, sailing for France with the Harvard Unit at the beginning of America's involvement in the Great War. But, readers will want more! Hopefully another volume will be published in the not too distant future.

Vincent J. Cirillo

***Drs. Abbott; Aria; Barrows;
Cobots; Cunningham; Forer;
Freeman; Gibbins; Glover;
Greene; Levinson; Praport;
Viteri; Yachnin***

Dr. Frank V. Abbott

Family practitioner and internal medicine specialist Frank Victor Abbott, M.D., died on December 19, 1987, at the age of 76. Born in South Orange, Dr. Abbott received his medical degree from the University of Bologna, Italy, in 1942. He served on the staff of Morristown Memorial Hospital, and was a member of our Morris County component and of the American Medical Association.

Dr. Michael H. Aria

Jersey City specialist in general surgery, Michael H. Aria, M.D., died on February 7, 1988, at the age of 89. A native of Messina, Italy, Dr. Aria received his medical degree from Eclectic Medical College, Cincinnati, Ohio, in 1926. He became affiliated with Palisades General Hospital, North Bergen; Riverside General Hospital, Secaucus; and Greenville Hospital, and Jersey City Medical Center, both in Jersey City. Dr. Aria was a member of our Hudson County component and of the American Medical Association. In 1976, he received MSNJ's Golden Merit Award for 50 years of medical practice.

Dr. Victor I. Barrows

Family physician Victor Ira Barrows, M.D., died on November 16,

1987, in Holiday, Florida, where he had been retired. A 1921 graduate of Jefferson Medical College of Philadelphia, Pennsylvania, Dr. Barrows maintained a North Wildwood practice and served on the staff of Burdette Tomlin Memorial Hospital in Cape May Courthouse. He was a member of our Cape May County component and of the American Medical Association. For 50 years of medical practice, Dr. Barrows received MSNJ's Golden Merit Award in 1971.

Dr. Joseph C. Cobots

Retired ophthalmologist Joseph Charles Cobots, M.D., died in May 1987, at the age of 81. Born in Italy, Dr. Cobots attended Jefferson Medical College of Philadelphia, Pennsylvania, where he received his medical degree in 1930. He became affiliated with Chester Hospital, Pennsylvania, as chief of ophthalmology; Wills Eye Hospital, Philadelphia; Crozer Hospital, Upland, Pennsylvania; and Sacred Heart Hospital, Chester, Pennsylvania. A Diplomate in ophthalmology, Dr. Cobots was a member of our Cape May County component and of the American Medical Association. In 1980, Dr. Cobots received MSNJ's Golden Merit Award.

Dr. Joel B. Cunningham

A general practitioner in Camden and Pennsauken for 45 years, Joel Bates Cunningham, M.D., 78, died on February 7, 1988, after 4 years of retirement. A native of Konawa, Oklahoma, Dr. Cunningham received his medical degree from the University of Arkansas School of Medicine, Little Rock, in 1936. He maintained a Camden practice from 1939 until 1969, when he moved to Pennsauken. During World War II, he served with the United States Army medical corps for 3 years, attaining the rank of major. Dr. Cunningham was a member of our Camden County component, and of the American Medical Association. In recognition of 50 years as a physician, Dr. Cunningham received MSNJ's Golden Merit Award in 1986.

Dr. Robert Forer

Trenton pediatrician Robert Forer, M.D., 84, died on February 29, 1988. A native of Poland, Dr. Forer

received his medical degree from New York University School of Medicine, New York, in 1928. A lifelong Trenton area resident, Dr. Forer maintained a Bellevue Avenue pediatric practice for 55 years, retiring only recently. Affiliated with Mercer Medical Center as its chief of pediatrics, and with Children's Hospital, Philadelphia, Dr. Forer was consulting pediatrician for the Trenton Head Start and Follow-Through programs; pediatrician for the Henry J. Austin Health Center, Trenton, from 1969 to 1983; and founder of the Medical Journal Club of Trenton. He was a United States Army medical corps veteran of World War II, having attained the rank of major. In 1978, he received the Medical Society of New Jersey's Golden Merit Award recognizing his 50 years as a physician. Dr. Forer was a member of our Mercer County component and of the AMA.

Dr. Joseph Freeman

Joseph Freeman, M.D., a family physician in Bayonne, died on January 25, 1988, at the age of 78. A native of Poland, Dr. Freeman was graduated from New York University School of Medicine, New York, where he received his medical degree in 1935. He became affiliated with Bayonne Hospital, and also maintained a private practice in Bayonne. He was a member of our Hudson County component and of the American Medical Association. For his 50 years as a physician, Dr. Freeman received MSNJ's Golden Merit Award in 1983.

Dr. A. Leslie Gibbins

General practitioner Albert Leslie Gibbins, M.D., died on December 27, 1987, at the age of 79. Born in Newark, Dr. Gibbins received his medical degree from Bellevue Hospital Medical College, New York, in 1933. He served on the staffs of Clara Maass Medical Center, Belleville; and Presbyterian Hospital, Newark. A Fellow of the American College of Surgeons, Dr. Gibbins was a member of our Ocean County component and of the American Medical Association. During World War II, he attained the rank of commander in the United States Navy. Dr. Gibbins received MSNJ's Golden Merit Award in 1983, for his 50 years of medical practice.

Dr. Lawrence L. Glover

Retired for 7 years in Toledo, Ohio, former Haddonfield family physician Lawrence Litchfield Glover, 70, died on February 19, 1988, at the age of 93. Born in Haddonfield, Dr. Glover received his medical degree from the University of Pennsylvania School of Medicine, Philadelphia, in 1920. He established a private practice in his hometown, maintaining this practice over 50 years, until his retirement. Dr. Glover was a member of our Camden County component and of the American Medical Association. He was a United States Army veteran of World War I. In 1970, Dr. Glover received MSNJ's Golden Merit Award.

Dr. Frank M. Greene, Jr.

Obstetrician-gynecologist Frank Matthew Greene, Jr., M.D., 47, died on February 9, 1988. Born in Passaic, Dr. Greene received his medical degree from Hahnemann Medical College and Hospital, Philadelphia, in 1966. For 15 years, he had a Carlstadt private practice, and became affiliated with Hackensack Medical Center. A Diplomate in obstetrics and gynecology, and a Fellow of the American College of Obstetricians and Gynecologists, Dr. Greene was a member of the American Fertility Society, of the New York Academy of Sciences, of our Bergen County Component, and of the American Medical Association. He was a veteran of the Vietnam War, serving as lieutenant and general surgeon in the United States Navy.

Dr. Reuben Levinson

General surgeon Reuben Levinson, M.D., died on February 22, 1988, at the age of 79. A native and life-long area resident of Perth Amboy, Dr. Levinson received his medical degree from the Faculty of Medicine, University of Edinburgh, Scotland, in 1936. He became affiliated with Raritan Bay Medical Center, Perth Amboy, and John F. Kennedy Medical Center, Edison. He maintained a private practice in Perth Amboy for many years. A Fellow of the International College of Surgeons, Dr. Levinson was a member of the Middlesex County component and of the American Medical Association. He was a veteran of World War II, having served as captain in the United States Army. Dr. Levinson was a 1986 recipient of MSNJ's Golden Merit Award.

Dr. Benny Praport

Gastroenterologist Benny Praport, of Elizabeth, died on December 16, 1987, at the age of 40. Born in Lodz, Poland, Dr. Praport received his medical degree from the University of Bologna, Italy. He became affiliated with Elizabeth General Medical Center, St. Elizabeth Hospital, and Alexian Brothers Hospital, all in Elizabeth. Dr. Praport was a member of the Academy of Medicine of New Jersey, of our Union County component, and of the AMA.

Dr. Luis E. Viteri

Retired Mt. Holly internist Luis E. Viteri, M.D., died on January 16,

1988, at the age of 84. Born in Ecuador, Dr. Viteri received his medical degree from the University of Pennsylvania School of Medicine, Philadelphia, in 1926. A Diplomate in internal medicine, Dr. Viteri was a Fellow of the American College of Physicians, and was a member of our Burlington County component and of the American Medical Association. In addition to maintaining a private practice, Dr. Viteri was affiliated with Memorial Hospital of Burlington County. He was a major in the United States Army during World War II. Dr. Viteri received MSNJ's Golden Merit Award in 1976.

Dr. Samuel C. Yachnin

Retired orthopedic surgeon Samuel C. Yachnin, M.D., 83, died on January 19, 1988, in Florida. A native of Russia, Dr. Yachnin received his medical degree from New York University School of Medicine, New York, in 1927. A Diplomate in orthopedic surgery, Dr. Yachnin was a Fellow of the American Academy of Orthopedic Surgeons and of the American College of Surgeons. He became affiliated with Beth Israel Hospital, Passaic, and the General Hospital Center at Passaic, where he was chief of orthopedics. Dr. Yachnin was consultant to orthopedic surgeons in the Virgin Islands, and to Patrice Air Force base in Florida. He was a member of our Passaic County component and of the AMA. He was a colonel in the United States Army. In 1977, he received the Golden Merit Award.

AUTHOR INFORMATION

New Jersey Medicine is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in New Jersey Medicine is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

INTENSIVE CARE.

Your practice deserves nothing less. And the Medical/Dental Banking Group at Midlantic National Bank/North is uniquely prepared to deliver the kind you need.

Whether you're a third-year resident or long-established in practice, a personalized loan package may be the best prescription for your future. We know the funding needs of new practices, buy-ins, buy-outs and practice expansion may exceed the lending limits of most financing sources. This is why we finance creatively, based on an understanding of medical economics and a repayment plan based on anticipated practice growth rather than fixed schedules.

We speak your language in other areas as well, with practice and personal services such as checking, savings, trust and estate planning, IRAs, custodial accounts, and more.

If you're starting out, start with our free brochure, "The Beginning Physician's Guide to Financing a Practice." Beginner or not, we urge you to call Patrick Robinson, Vice President and Group Manager, toll-free at 1-800-633-0040.

We'd like to make a "house call," and show you how our intensive care can help your practice.

MEMBER FDIC

Specify
Adjunctive

LIBRAX[®]

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows:

“Possibly” effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium[®] (chlordiazepoxide HCl/Roche) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur.

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

ROCHE

Roche Products Inc.
Manati, Puerto Rico 00701

To insist
on the brand,
be sure to specify
"Do Not Substitute."

When brain and bowel conflict...

It's time for the Peacemaker.

In irritable bowel syndrome* anxiety can aggravate intestinal symptoms, which may further intensify anxiety — a distressing cycle of brain/bowel conflict. Librax intervenes with two well-known compounds. The Librium® (chlordiazepoxide HCl/Roche) component safely relieves anxiety. And Quarzan® (clidinium bromide/Roche) provides antisecretory and antispasmodic action to relieve discomfort associated with intestinal hypermotility.

Dual action — for peace between brain and bowel. Because of possible CNS effects, caution patients about engaging in activities requiring complete mental alertness. Specify Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl
and 2.5 mg clidinium bromide

*Librax has been evaluated as possibly effective as adjunctive therapy in the treatment of peptic ulcer and the irritable bowel syndrome.

INTRODUCING **MEMO PAGER**

THE BEEPER THAT ALLOWS YOU TO DIAGNOSE YOUR MESSAGES!

When time is important, you want to know if your messages demand immediate action, or can wait while you attend to more pressing matters.

Now, MEMO PAGER, the Beeper that displays a **written** message, allows you to determine instantly if that message is an emergency.

That can not only save time, it could even save lives.

Designed for physician's, hospitals and health-related organizations, MEMO PAGER can be an indispensable link between doctors, nurses, and other staff personnel.

Here are some of the advantages you have with MEMO PAGER :

- Receive written messages from hospital and staff, wherever you may be.
- Receive confidential medical information at any time.
- Eliminate "telephone tag" by getting a full written message instead of just a phone number.
- Receive up to 1,950 characters, including code letters.
- Store up to sixteen written messages for later review.
- Signal when battery is low.

Get your MEMO PAGER from Radio Call Co. and get 10,000 SQUARE MILES OF COVERAGE in the metro New York area (including Montauk LI, Fairfield CT, Rockland, Westchester and Northern NJ).

MEMO PAGER — Just **\$38.50** per month (lower prices in quantity)

FREE Computer Terminal with Keyboard and Modem when you order six or more!

Call for the office nearest you.

**“A big insurance company
that helps me build my practice?**

**I don't
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

You told us you wanted an insurance program that can help broaden your patient base. Your patients told us they wanted more comprehensive medical coverage.

We listened. And developed Medallion. The best insurance for a healthy practice ...and your patients.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year inquiring about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you because with only a minimum of out-of-pocket expense, they will receive the maximum benefits of Medallion from a participating physician.

Comprehensive fee-for-service.

Medallion compensates you for the services you render while providing comprehensive care for your patients, including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not yet a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

AMERICAN MEDICAL ASSOCIATION

Price Controls

The AMA commissioned a panel of economic experts to determine whether or not the imposition of price controls was an appropriate method to be used in controlling the rise in cost of medical care. The panelists included: Elizabeth E. Bailey, William J. Baumol, James M. Buchanan, Carl F. Christ, H.E. Frech, III, Lawrence R. Klein, Marc L. Nerlove, Sam Peltzman, James B. Ramsey, Richard L. Schmalensee, Martin Shubik, and Sir Alan Walters. The following is a summary of their report:

During the last several decades, the costs of medical services have been rising at a rate persistently more rapid than that of the general price level. This constitutes a real and very urgent problem for the poor, in general, and for the elderly poor, in particular. But it is a problem which cannot be solved by legislation which seeks to declare its symptoms illegal. Recent proposals undertaking to impose ceilings on the fees that doctors would be permitted to charge their Medicare patients amount to the imposition of a system of price controls. As with most price control measures, these proposals are not only likely to fail to achieve their objective, but are apt to impose a costly burden upon the very persons whose interests they would attempt to protect.

In common with many other personal services, such as education, the performing arts, and a variety of services performed by state and local governments, the costs and prices of medical services have indeed risen at rates substantially higher than the economy's overall rate of inflation. During the 40-year period since 1947, according to U.S. government statistics, in constant dollars, the price of a visit to a doctor's office has risen some 150 percent, the cost of elementary education per pupil per day has risen about 300 percent, and the cost of a day of hospital care has increased approximately 1,750 percent.

No one is sure of the full explanation of these very substantial increases in the cost of medical services. But the rising physician-population ratio, the rising proportion of applicants accepted by medical schools, the increase in the number and membership of organizations such as HMOs (health maintenance organizations) and PPOs (preferred provider organizations) whose objective is to hold down medical care costs, and the fact that (in constant dollars) physician incomes have been virtually constant for more than a decade, all suggest that there has been no decline in

competitiveness in the health care area such as would account for the pattern of sharp increase in the relative prices of medical services. There is good reason to conclude, rather, that a substantial role was played by the fact that medical care is a personal service which is not amenable to the rates of productivity increase which, for example, have constrained the rates of price increases of manufactured products.

It is important to explore the sources of the price increases experienced by medical services because only after the causes are understood can a rational policy for the containment of the effects of those price increases be formulated. Moreover, to the extent that the price increases are to be attributed to real and largely unavoidable cost increases, rather than to the imperfect competitiveness of the medical care industry, the perils of the price control approach are necessarily exacerbated. If rising prices merely reflect real and unavoidable cost increases, a ceiling in prices will inevitably serve, in the long run, to curtail the supply of medical services in general; and a ceiling on fees for the treatment of the elderly is sure to reduce the quality and quantity of services supplied to this population group. Experience shows that, in the long run, it may even increase the prices this group is required to pay. In sum, such controls under these circumstances would constitute no benefit to the group of persons they are intended to protect.

We strongly urge that price controls for medical services not be adopted precipitously. We believe that careful consideration of the matter will make it clear that price control measures for medical services are to be avoided altogether, and that a serious social problem such as this one merits a more reasoned and more promising approach.

MEDICAL SOCIETY OF NEW JERSEY

Auxiliary Information

The Auxiliary supplies needed assistance to the Society in many areas. Lobbying assistance and medical student loan fundraising by Auxiliary members have been invaluable to our efforts.

The Board of Trustees encourages each of you to urge your spouse to become a member of the Auxiliary, and to participate in its physician-focused activities.

PUBLIC AFFAIRS UPDATE

CLARK MARTIN*

**Medical Waste News;
Financial Disclosure
Advances; Monopoly
on Modalities**

GOOD NEWS ABOUT MEDICAL WASTE

A medical waste bill which would have created added expense and red tape has been amended so that it no longer would burden the private physician.

Sponsored by Assemblyman Anthony "Doc" Villane (R-Eatontown), A-2853 now would affect only facilities such as hospitals, ambulatory surgical centers, clinics, and nursing homes. Part of a package of bills intended to prevent ocean and beach pollution, the measure would create a new method of monitoring and disposing of medical waste.

In its original form, A-2853 was the joint product of the Department of Health and the Department of Environmental Protection (DEP). It required physicians and other practitioners to register with the DEP, separately package and identify their waste as either "general" or "special," and assure that it is hauled away by garbage specialists. If enacted, the bill would have been a nightmare. It contemplated a solid waste collection and manifesting system which today does not exist. And it required special handling for such benign items as rubber gloves, tongue depressors, bandages, and cotton swabs which in the household would be considered ordinary trash.

Assemblyman Villane strongly supported the Society's amendment. Working with health care providers and other affected professions (dentists, hospitals, nursing homes, funeral directors, and veterinarians) we proposed a number of alternatives to him and to the sponsor of a companion Senate bill, Frank Pallone (D-Long Branch).

With the amendments, the bill now requires affected facilities to arrange for the separate handling of "special" medical waste: infectious waste, body parts, needles, syringes, sharps, and pathology specimens.

The Health Department insists that private practitioners be brought back into the bill, and the DEP still wants special treatment for "general" medical waste. Thus, additional legislation may follow.

FINANCIAL DISCLOSURE ADVANCES

Financial disclosure—the Society's alternative to lobbying efforts aimed at prohibiting physicians from owning a variety of health care services—is well on its way to becoming law.

Sponsored by Senators Richard Codey (D-West Orange) and John Russo (D-Toms River), a disclosure bill has passed the Senate unanimously and has been sent to the Assembly Health Committee.

The bill, S-734-2091, affects practitioners regulated by the State Board of Medical Examiners (physicians, podiatrists, and chiropractors). It acknowledges their right to own or invest in health care services, and requires them to disclose that fact whenever they refer a patient to a facility in which they, or a member of their immediate family, have an interest.

Disclosure is required if the practitioner owns 5 percent or more of the service, or if the investment exceeds \$5,000. Ownership of a building in which space is leased to a health care service need not be disclosed.

The bill applies to such services as a pharmacy, nursing home, bioanalytical laboratory, home health care agency, radiological facility, and ophthalmic service.

At the Society's suggestion, a provision was deleted which would require a practitioner to give the patient the names, addresses, and telephone numbers of at least three alternative providers of a service. The bill requires the patient be given a disclosure form noting other services can be found in the classified section of the telephone directory.

An identical bill, A-2485, has been introduced in the lower house by Assemblyman Chuck Haytaian (R-Hackettstown). It, too, has been referred to the Assembly Health Committee.

MONOPOLY ON "MODALITIES"?

It's no secret that physical therapists are chafing under the Medical Examiners' rule which permits practitioners to direct an unlicensed employee to administer "physical modalities." Elimination of this rule was one of the goals of the PT prohibition bill (A-2647) which failed in the last legislative session and now has been superseded by the financial disclosure measure.

Thus, we're not surprised to discover a new bill which would prohibit a physician, podiatrist, or chiropractor from using any employee, other than a physical therapist, to administer physical modalities. The bill S-2509/A-3166 is sponsored by Senator John Lynch (D-New Brunswick), Assemblymen Anthony Impeveduto (D-Secaucus), and Joseph Doria (D-Bayonne).

Modalities mentioned in the bill include heat, diathermy, cold, ultrasound, ultraviolet rays, cold quartz rays, and electromagnetic rays.

While the bill would foster employment for physical therapists, we wonder whether it has anything to do with improved health care.

State Affairs

Board of Registration's Decision To Revoke License for Negligence in Another State; Missouri Court Does Not Have Jurisdiction over Texas Hospital; New Pap Test Guidelines; Blood Donor Identities; Consulting Activities of Expert Witness

COURT UPHOLDS BOARD OF REGISTRATION'S DECISION TO REVOKE LICENSE FOR NEGLIGENCE IN ANOTHER STATE

Distracted by malpractice costs and lawsuits, physicians may not be aware that state boards of registration have adopted newly aggressive postures. Once sleepy entities that rarely disciplined physicians, today these boards have been given the mandate and the staff to find and discipline medicine's "bad apples."

As the number of license revocations and suspensions have risen, physicians who have been punished have appealed to the courts. These appellate decisions suggest that the boards have great power and wide latitude in which to exercise it, as the following case (Haran versus Board of Registration in Medicine, 398 Mass 571, 1986) illustrates.

In 1979, a disciplinary authority in New York determined that Patrick Haran was guilty of negligence and professional incompetence on at least 12 occasions and revoked his license. Dr. Haran also was licensed in Massachusetts. About a year later, the Massachusetts Board of Registration in Medicine adopted a rule permitting it to give collateral estoppel effect to a sister state's disciplinary actions if they were "for reasons substantially the same as those for which a physician might be disciplined in Massachusetts."

In 1981, based exclusively on the New York determination, the Massachusetts Board initiated action against Dr. Haran, and in 1984 it voted to suspend his license for two years. Noting however, that in the in-

terim Haran had regained his New York license, it stayed the suspension.

Dr. Haran appealed the decision to a single justice who vacated the suspension, ruling that it was inappropriate to apply the collateral estoppel rule retroactively. The Board appealed to the Supreme Judicial Court which reinstated the decision. The Supreme Judicial Court held that the rule had not been applied retroactively, noting that for a statute to be found to operate retroactively it must be shown that "substantive" as opposed to procedural rights were adversely affected.

Dr. Haran's arguments had systematically addressed this point, but the Supreme Judicial Court was unpersuaded. It rejected his view that the term "substantially" made the regulation so loosely drafted as to permit the board to discipline him for conduct prescribed elsewhere, but not in Massachusetts. It also rejected his argument that he should have a chance to disprove what was decided in New York.

Dr. Haran's most persuasive point was that if the Massachusetts Board was going to act solely on the basis of a sister state's disciplinary action, it must do so entirely. Since New York had returned his license, Massachusetts should not now suspend it. This, too, the higher court rejected, agreeing with the Board that the determination of rehabilitation was much less well suited to collateral estoppel than was a finding of negligence. It found the regulatory design to be neither unreasonable nor unfair. It wrote that the Board should enjoy wide latitude not only to decide factual questions on the basis of the members' expertise, but also to decide on that same basis whether the issue of rehabilitation is or is not a question for collateral estoppel.

There are few better examples of the vast powers of state boards than this case. (*Medical Liability Monitor*, Vol. 13, Number 2, February 29, 1988)

MISSOURI COURT DOES NOT HAVE JURISDICTION OVER TEXAS HOSPITAL

A Texas hospital that provided a donor heart for a transplant was not subject to jurisdiction in a wrongful death action in a Missouri court, a Missouri appellate court ruled. The hospital had provided a blood type A heart for a transplant into a patient in St. Louis. After removal of the patient's heart and shortly before completion of the operation, the operating physician was advised that the donor heart was in fact of blood type B. Having no other heart available, the physician completed the operation. After some time, the patient began rejecting the heart. Another transplant was performed, but that heart deteriorated and the patient subsequently died. The patient's widow filed a wrongful death action against the operating physician and the hospital that had provided the donor heart. The trial court denied the hospital's motion to dismiss for lack of jurisdiction. The hospital then sought an order from the appellate court to prevent further action of the trial court. Granting the hospital's request, the

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects, respectively.

court said that the hospital did not have sufficient minimum contacts with the state of Missouri to satisfy due process requirements. The Texas hospital was not subject to the jurisdiction of the Missouri court. (Reprinted from *Citation* (Volume 56, No. 4, December 1, 1987), with permission, AMA, 535 N. Dearborn St., Chicago, IL 60610)

NEW PAP TEST GUIDELINES

Conservative time intervals when Papanicolaou (Pap) smears generally should be performed were recommended by four national medical organizations at a press conference held at the Press Club in Washington, D.C. The consensus guidelines were discussed by representatives of the American Cancer Society, AMA, American College of Obstetricians and Gynecologists, and The National Cancer Institute. Developed during the past year, the guidelines are intended to encourage professional consistency in time intervals for scheduling Pap smear screens. They also allow for flexibility based on professional judgment for patients whose histories indicate they may be at a higher risk of developing cervical cancer.

Harry Jonas, M.D., AMA's Director of Undergraduate Medical Education, explained the reasons why the four medical groups developed the guidelines. "For the past eight years," he said, "American women must have been confused with the conflicting advice they were getting from the major health and medical organizations about how often they should have Pap tests as protection against getting cervical cancer. Today we hope to put to rest some of that confusion." The guidelines, which were approved by the AMA's House of Delegates at the 1987 Interim Meeting call for three successive annual screens for sexually active women over age 18. If test results are negative, subsequent periodic screens should be performed at the discretion of physician and patient, but not less frequently than every three years, the organizations recommend. (*FedNet*, February 1, 1988)

DISCOVERY OF BLOOD DONOR IDENTITIES

Court-ordered discovery of the identities and addresses of blood donors did not violate the donors' liberty interests, a Texas appellate court ruled.

The father of a patient who contracted AIDS and died after receiving blood transfusions sued a hospital for wrongful death. He accused the hospital of failing to exercise the degree of care, skill, and treatment ordinarily expected and failure to provide a wholesome blood product.

The father served the hospital with a request for production of information relating to blood donors. The trial court overruled the discovery objection and ordered that the hospital disclose the identities and addresses of the donors. The court ordered the father not to directly or indirectly contact any donor or undertake further discovery as to such donors until permitted to do so by court order.

The hospital sought a writ of mandamus to compel the trial judge to rescind the order permitting discovery. The hospital contended that the order violated the blood donors' constitutional right to privacy and that the societal interest in maintaining a healthy and

effective blood donor program overrode any legitimate interest in disclosure of the blood donors' identities.

The appellate court found that the physician-patient privilege was not applicable, since nothing in the record indicated that the blood donors were seen by a physician or received medical care when they donated the blood. The court also held that the order was not an impermissible violation of the donors' rights to privacy. The court said that the father's interest in the identity of the donors was legitimate. Without such information, the court said, it was unlikely that he could prosecute the cause of action against the hospital. Further, the court said that the record did not support the hospital's contention that the donors had a need of anonymity that was greater than the father's need.

From the record, the court said that it appeared that the hospital had made no effort to determine whether any of its donors had been identified as having AIDS. The court said that a finding of injury to society's interest by the limited discovery was no less speculative than a determination that the order would benefit society by discouraging blood donations by AIDS victims. The hospital did not provide evidence to show that the information sought would be used improperly.

Since the trial court's order showed a proper concern with protection of the individual's right of privacy, the court denied the hospital's motion for a writ. (Reprinted from *THE CITATION*, January 15, 1988, Vol. 56, No. 7, with permission, AMA, 535 N. Dearborn St., Chicago, IL 60610)

CONSULTING ACTIVITIES OF EXPERT WITNESS

The Illinois Supreme Court has unanimously held that a trial court has discretion to permit cross-examination of an expert witness in a medical liability action with respect to the number of cases in which he had testified and his annual income derived from expert counseling activities. The decision reversed the appellate court and marks a departure from an older line of Illinois cases which suggested that expert witnesses should not be questioned regarding such matters.

In the course of the trial, the expert physician testified on direct examination as to his education, his experience as a general practitioner, and other qualifications. He also stated that he was asked to review the case by the American Board of Medical Legal Consultants which he described as a group of consultants of which he was a "fellow," that attempt to determine whether "lack of standard of care, injuries, or malpractice has occurred in a variety of cases."

On cross-examination, the expert physician indicated that the Board was a profit-making organization, the purpose of which was to review cases involving suspected malpractice and to furnish expert testimony. He stated that more than 80 percent of his time was devoted to work for the Board and that since 1983, he had reviewed more than 700 cases, given depositions in approximately 60 of these cases, and testified in about 30 trials. These trials involved a diversity of medical treatments, ranging from alleged inadequate neurological examination to the development of bone infection. The expert physician also testified that the majority of his work was for plaintiffs. (*Professional Liability Update*, March 1988.)

Before prescribing, see complete prescribing information in SK&F LAB CO. literature or PDR. The following is a brief summary.

Contraindications: There are no known contraindications to the use of 'Tagamet'.

Precautions: While a weak antiandrogenic effect has been demonstrated in animals, 'Tagamet' has been shown to have no effect on spermatogenesis, sperm count, motility, morphology or in vitro fertilizing capacity in humans.

In a 24-month toxicity study in rats at dose levels approximately 9 to 56 times the recommended human dose, benign Leydig cell tumors were seen. These were common in both the treated and control groups, and the incidence became significantly higher only in the aged rats receiving 'Tagamet'.

Rare instances of cardiac arrhythmias and hypotension have been reported following the rapid administration of 'Tagamet' HCl (brand of cimetidine hydrochloride) injection by intravenous bolus.

Symptomatic response to 'Tagamet' therapy does not preclude the presence of a gastric malignancy. There have been rare reports of transient healing of gastric ulcers despite subsequently documented malignancy.

Reversible confusional states have been reported on occasion, predominantly in severely ill patients.

'Tagamet' has been reported to reduce the hepatic metabolism of warfarin-type anticoagulants, phenytoin, propranolol, chlordiazepoxide, diazepam, lidocaine, theophylline and metronidazole. Clinically significant effects have been reported with the warfarin anticoagulants; therefore, close monitoring of prothrombin time is recommended, and adjustment of the anticoagulant dose may be necessary when 'Tagamet' is administered concomitantly. Interaction with phenytoin, lidocaine and theophylline has also been reported to produce adverse clinical effects.

However, a crossover study in healthy subjects receiving either 'Tagamet' 300 mg. q.i.d. or 800 mg. h.s. concomitantly with a 300 mg. b.i.d. dosage of theophylline (Theo-Dur®, Key Pharmaceuticals, Inc.),

demonstrated less alteration in steady-state theophylline peak serum levels with the 800 mg. h.s. regimen, particularly in subjects aged 54 years and older. Data beyond ten days are not available. [Note: All patients receiving theophylline should be monitored appropriately, regardless of concomitant drug therapy.]

Lack of experience to date precludes recommending 'Tagamet' for use in pregnant patients, women of childbearing potential, nursing mothers or children under 16 unless anticipated benefits outweigh potential risks; generally, nursing should not be undertaken in patients taking the drug since cimetidine is secreted in human milk.

Adverse Reactions: Diarrhea, dizziness, somnolence, headache, rash. Reversible arthralgia, myalgia and exacerbation of joint symptoms in patients with preexisting arthritis have been reported. Reversible confusional states [e.g., mental confusion, agitation, psychosis, depression, anxiety, hallucinations, disorientation], predominantly in severely ill patients, have been reported. Gynecomastia and reversible impotence in patients with pathological hypersecretory disorders receiving 'Tagamet', particularly in high doses, for at least 12 months, have been reported. Reversible alopecia has been reported very rarely. Decreased white blood cell counts in 'Tagamet'-treated patients (approximately 1 per 100,000 patients), including agranulocytosis (approximately 3 per million patients), have been reported, including a few reports of recurrence on rechallenge. Most of these reports were in patients who had serious concomitant illnesses and received drugs and/or treatment known to produce neutropenia. Thrombocytopenia (approximately 3 per million patients) and a few cases of aplastic anemia have also been reported. Increased serum transaminase and creatinine, as well as rare cases of fever, interstitial nephritis, urinary retention, pancreatitis and allergic reactions, including hypersensitivity vasculitis, have been reported. Reversible adverse hepatic effects, cholestatic or mixed cholestatic-hepatocellular in nature, have been reported rarely. Because of the predominance of cholestatic features, severe parenchymal injury is considered highly un-

likely. A single case of biopsy-proven periportal hepatic fibrosis in a patient receiving 'Tagamet' has been reported.

How Supplied: Tablets: 200 mg. tablets in bottles of 100; 300 mg. tablets in bottles of 100 and Single Unit Packages of 100 (intended for institutional use only); 400 mg. tablets in bottles of 60 and Single Unit Packages of 100 (intended for institutional use only), and 800 mg. Tiltab® tablets in bottles of 30 and Single Unit Packages of 100 (intended for institutional use only).

Liquids: 300 mg./5 ml., in 8 fl. oz. (237 ml.) amber glass bottles and in single-dose units (300 mg./5 ml.), in packages of 10 (intended for institutional use only).

Injections:

Vials: 300 mg./2 ml. in single-dose vials, in packages of 10 and 30, and in 8 ml. multiple-dose vials, in packages of 10 and 25.

Prefilled Syringes: 300 mg./2 ml. in single-dose prefilled disposable syringes.

Plastic Containers: 300 mg. in 50 ml. of 0.9% Sodium Chloride in single-dose plastic containers, in packages of 4 units. No preservative has been added.

ADD-Vantage® Vials: 300 mg./2 ml. in single-dose, ADD-Vantage® Vials, in packages of 25.

Exposure of the premixed product to excessive heat should be avoided. It is recommended the product be stored at controlled room temperature. Brief exposure up to 40°C does not adversely affect the premixed product.

'Tagamet' HCl (brand of cimetidine hydrochloride) injection premixed in single-dose plastic containers is manufactured for SK&F Lab Co. by Travenol Laboratories, Inc., Deerfield, IL 60015.

* ADD-Vantage® is a trademark of Abbott Laboratories.

Putting Down His Pen

*After 15 years of service to
NEW JERSEY MEDICINE, Dr. Krosnick
retires.*

The following Resolution was
unanimously adopted by the
MSNJ Board of Trustees:

Whereas, Dr. Arthur Krosnick has announced
his retirement from the editorship of *NEW
JERSEY MEDICINE*; and

Dr. Krosnick in his Princeton office.

Arthur Krosnick, M.D.

© Spud Grammar

Whereas, Dr. Arthur Krosnick has served for 15
years as Editor of *NEW JERSEY MEDICINE* and
its predecessor *The Journal of the Medical So-
ciety of New Jersey*; and

Whereas, under the leadership of Dr. Arthur
Krosnick, our journal has achieved new stan-
dards of excellence; and

Whereas, our journal has received first place
awards in national competition for state medical
society publications, in two of the past three
years; now therefore be it

**Resolved, that the Medical Society of New
Jersey express its gratitude and appreciation to
Dr. Arthur Krosnick for the excellence of his
leadership of *NEW JERSEY MEDICINE/The
Journal of the Medical Society of New Jersey*;
and be it further**

**Resolved, that the Medical Society of New
Jersey commend Dr. Arthur Krosnick for his
long and untiring efforts on behalf of the Medi-
cal Society and our journal; and be it further**

**Resolved, that this Resolution be spread upon
the minutes of the Society, and be published in
NEW JERSEY MEDICINE; and that a copy, suit-
ably prepared, be presented to Dr. Arthur
Krosnick.**

WE
CAN

Feel

[illegible]

Like a MILLION

...like the more than one million patients who have received **INDERAL® LA** for all its indications.

In an unprecedented program,¹ over 9,000 physicians nationwide profiled 234,505 patients receiving **INDERAL LA** for *hypertension*. In a subsequent survey, 4,120 of these participating physicians gave us their views on the performance of **INDERAL LA**.

The consensus[†]:

Nearly three out of four physicians responding to the survey consider **INDERAL LA** their preferred beta blocker for hypertension—preferring to prescribe it before ACE inhibitors, calcium channel blockers, and alpha blockers. Forty-nine percent of these physicians also preferred to prescribe **INDERAL LA** before diuretics.

Nearly all physicians cited **INDERAL LA** for its good to excellent tolerability and rated **INDERAL LA** good to excellent in promoting patient compliance.

Surprising?

Not really. Evaluate **INDERAL LA** in your own practice and see. Expect your next **INDERAL LA** patient to feel like a million.

INDERAL LA should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree, and bronchial asthma.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION, SEE PACKAGE CIRCULAR.)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. INDERAL LA is formulated to provide a sustained release of propranolol hydrochloride. INDERAL LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. INDERAL is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by INDERAL, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

INDERAL LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with INDERAL LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of INDERAL Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

INDERAL LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to INDERAL LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, INDERAL LA has been therapeutically equivalent to the same mg dose of conventional INDERAL as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure, and rate pressure product. INDERAL LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. Hypertension: INDERAL LA is indicated in the management of hypertension; it may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. INDERAL LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: INDERAL LA is indicated for the long-term management of patients with angina pectoris.

Migraine: INDERAL LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: INDERAL LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. INDERAL LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. INDERAL is contraindicated in 1) cardiogenic shock; 2) sinus bradycardia and greater than first-degree block; 3) bronchial asthma; 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with INDERAL.

WARNINGS. CARDIAC FAILURE: Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or INDERAL should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of INDERAL therapy. Therefore, when discontinuance of INDERAL is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If INDERAL therapy is interrupted and exacerbation of angina occurs, it usually is advisable to reinstitute INDERAL therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema)—PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. INDERAL should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY: The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

INDERAL (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOGLYCEMIA: Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS: Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 , and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. GENERAL: Propranolol should be used with caution in patients with impaired hepatic or renal function. INDERAL (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should be cautioned that INDERAL may interfere with the glaucoma screening test. Withdrawal may lead to a return to increased intraocular pressure.

CLINICAL LABORATORY TESTS: Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS: Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if INDERAL (propranolol HCl) is administered. The additive catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncope, ataxic or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure, or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenytoin, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY: Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY: Pregnancy Category C. INDERAL has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. INDERAL should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS: INDERAL is excreted in human milk. Caution should be exercised when INDERAL is administered to a nursing woman.

PEDIATRIC USE: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular: Bradycardia; congestive heart failure; intensification of AV block; hypotension; paraesthesia of hands; thrombocytopenic purpura; arterial insufficiency, usually of the Raynaud type.

Central Nervous System: Light-headedness; mental depression manifested by insomnia, lassitude, weakness, fatigue; reversible mental depression progressing to cataplexy; visual disturbances; hallucinations; vivid dreams; an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy, and vivid dream appear dose related.

Gastrointestinal: Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic: Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory: Bronchospasm.

Hematologic: Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-immune: In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous: Alopecia, LE-like reactions, psoriasisform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (practolol) have not been associated with propranolol.

DOSAGE AND ADMINISTRATION. INDERAL LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from INDERAL Tablets to INDERAL LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. INDERAL LA should not be considered a simple mg-for-mg substitute for INDERAL. INDERAL LA has different kinetics and produces lower blood levels. Retitration may be necessary especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION—Dosage must be individualized. The usual initial dosage is 80 mg INDERAL LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS—Dosage must be individualized. Starting with 80 mg INDERAL LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE—Dosage must be individualized. The initial oral dose is 80 mg INDERAL LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, INDERAL LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS—80-160 mg INDERAL LA once daily.

PEDIATRIC DOSAGE— At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

INAUGURAL ADDRESS

PALMA E. FORMICA, M.D., OLD BRIDGE

Palma E. Formica, M.D., presented this Address at her inauguration on April 29, 1988, at the Annual Meeting of the Medical Society of New Jersey, at the Sheraton Meadowlands Hotel in East Rutherford.

Let me begin by saying "Thank you," thank you for the honor of being the 196th president of the

Medical Society of New Jersey. No one reaches this position alone. The support and encouragement of each of you, mentors, role models, peers, colleagues, family, and friends have made it possible for me.

My thanks also are extended to our past presidents. Each has given selfless and dedicated service for the betterment of the profession and the health of the people of this state. They have left their mark on the history of this Medical Society.

To my immediate predecessor, I extend a special word of appreciation. Harry Carnes is unique in so many ways. He set a collegial tone, sharing many of his presidential activities with the other officers. He has started much. I hope to give continuity to the programs underway, such as: The AIDS Task Force; the Seniors' Courtesy Program; involvement in the legislative arena; continued dialogue with the commissioners of health and insurance, as well as cooperation with the State Board of Medical Examiners. Membership recruitment and leadership development will continue.

As president of the Medical Society of New Jersey, I represent you. Your concerns, frustrations, and problems are ours. Together we can find solutions.

Today, we pursue our profession in many ways: as solo or group practitioners, as specialists and general-

ists, as researchers in industry and academic institutions, as administrators and as medical staff members, as teachers, and as students, just to mention a few.

There are potentials for division. The young against the older, the town-gown syndrome; those employed by institutions or groups; and the self-employed. Yet, in all this diversity, there is the unity of belonging to a professional organization which binds us all together, which acts as our advocate and champions the cause of our patients.

I ask you to celebrate with me the 222nd year of the Medical Society of New Jersey; to celebrate being physicians, and to celebrate being called to the profession of healing.

I know some of you may be thinking, "Celebrate"? What is there to celebrate? Times could not be worse for doctors. We are being manipulated, maligned, and maltreated by government, business, and even the public. Every day brings a new threat: the professional liability crisis, PRO sanctions, managed care; capitation, leveraged competition; mandatory assignment, and many more. We are blamed for the high cost of medical care. They say it is inappropriate, ineffective, and unwarranted. We are accused of being entrepreneurs, hucksters, and greedy fat cats interested only in our pocketbooks.

And you say "celebrate"?

My answer is a resounding yes. It is time for us to

announce publicly that we are proud to be physicians providing the best in health care. We know why we are physicians, for the benefit of patients.

PROFESSIONALISM

The most serious threat facing us today is the temptation to yield to those pressures and criticisms which would destroy our very professionalism. Do we still meet the qualifications of a professional?

A professional has a unique body of knowledge.

We recommit ourselves to preserving and advancing that scientific body of knowledge we call medicine. Despite our own frustrations, we must encourage the brightest and the best to follow this noble calling, and when they are accepted into medical school with its rigorous training, we must insist that striving for excellence is the hallmark of both the art and science of medicine. As role models and mentors, we must continue to be part of their training. Our specialty programs and residencies must not only provide state-of-the-art education but must respond to the needs of the people. Our goal in education must be to prepare ethical, competent, and caring practitioners. Every one of us has that responsibility.

Physicians have a lifelong obligation of learning, not only for our personal satisfaction and intellectual curiosity, but also for our patients so that we can "apply and advance scientific knowledge and make that information available" for the well-being and health of our patients and the public.

CODE OF ETHICS

A profession is governed by a code of conduct.

The ideals of our profession are embodied in the code of ethics dating back 2,400 years ago to Hippocrates, the Father of Medicine. At graduation, each of us took this oath. Its principles are just as valid today. We are doctors for patients, their welfare must come before our own. The World Health Organization sums it up clearly: "The health and welfare of patients shall be the first consideration, not allowing economics, politics, race, or religion to take precedence."

Our own American Medical Association has said: "Ethical statements are developed primarily for the benefit of the patient."

We believe a physician "shall be dedicated to providing competent medical service with compassion and respect for human dignity; and we shall deal honestly with patients and colleagues, respect the law and recognize a responsibility to seek changes for the best interest of patients, respect rights of patients and of colleagues, and safeguard confidences."

Throughout the ages we have promised to respect our teachers, to educate students, to place the good of the patient above all else, to do no harm, and to pursue the art in a spirit of collegiality and mutual respect.

We rededicate ourselves to these ideals. We stand tall and unashamed of committing ourselves to others, protecting the patient from harm when he is most vulnerable and defenseless. The very code that binds us as physicians is more demanding than any law, rule, or regulation of the marketplace. The skeptics may doubt us; they always have. Our actions must drown out the clamor of our critics.

OUR CHALLENGES

Autonomy. The most critical challenge we face today is the intrusion of third parties into medical decision making. The right of professional autonomy is fundamental to the doctor-patient relationship and quality care.

Will we yield this basic freedom to government, business, or third-party payors? Will we have the courage to say, "No more! The good of my patient comes first"? Every time we intervene on a patient's behalf, we make that point.

Self-regulation. With rights and freedom in decision making comes the obligation of self-regulation and accountability. Physicians alone have the expertise to set standards, evaluate treatment modalities, and review each other. Every time we are reviewed or engage in peer review through various hospital and government and medical society review, we are regulating ourselves. Whenever we discover and report an impaired or incompetent colleague, we acknowledge our responsibility to the profession and to the public.

A license to practice is a privilege. Those who use it to exploit patients must be reported immediately, and disciplined by the appropriate agencies.

Dr. Edmond Pellegrino has said, "Medicine needs persons habitually disposed to do the right and good thing—even when they are not being watched. We are called to a higher standard of performance."

Accountability. Essential to self-regulation and professional autonomy is accountability. The entire thrust of the quality assurance programs is to demonstrate that patient care is being provided competently, appropriately, and in a cost-effective manner. As the profession seeks to find a mechanism to demonstrate quality, we physicians must be in the vanguard.

We have no fears of being accountable. More than any other profession, medicine has led the way. However, we will not sacrifice quality and humanity on the altar of cost containment.

COVENANT OF CARING

The unique aspect of being a physician is the doctor-patient relationship. It is the touchstone of our professional commitment. It is not a contract between the provider of a commodity purchased by a consumer. How instinctively we are repulsed by this definition of the social planners. It is the most sacred bond between the physician and the patient. It is a relationship—a covenant of caring. As physicians, we are privileged to serve; to be a part of a healing process, to care for those who are burdened by pain, disease, and suffering. We—the patients and us—are "connected" in joys and sorrows, hopes, and frustrations.

Physicians bring the gifts of expertise, skill, knowledge, understanding, and compassion. Our patients gift us with trust, affirmation, and meaning. Serving people—one at a time—is what we are all about.

We pledge to our patients and to each other our dedication to this covenant of caring. Are we still professionals? Do we meet the qualifications? We will not be discouraged by the problems facing medicine. There have been others in the past. With persistence and commitment, we will prevail again.

The art and profession is not dead!

Come celebrate with me the joy of being a physician.

BETTER CARE MEANS GOING THAT EXTRA MILE.

From the moment patients arrive at The Mid-Atlantic Kidney Stone Center, we want them to feel comfortable and at ease. We begin by showing them a videotape explaining the lithotripsy treatment process, followed by a tour of our facility. Along the way we introduce them to the staff who will be providing their care.

We then make every effort to answer patient questions and address their concerns. Even though they are in our care for

just a few hours, we do our best to make the experience as pleasant as possible. Patients appreciate the personalized care at the Mid-Atlantic Kidney Stone Center.

In nearly three years of experience as a lithotripsy service, we have treated more than 3000 kidney stone patients from New Jersey, Eastern Pennsylvania, metropolitan New York and Del-

aware. We believe that our expertise makes us uniquely qualified to serve you and your patients.

If needed, we offer complimentary transportation and hotel accommodations for patients traveling to the Mid-Atlantic Kidney Stone Center. To find out more about our service, or how you can obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337. Outside of New Jersey, call (800) 53-LITHO.

FAREWELL ADDRESS

HARRY M. CARNES, M.D., AUDUBON

Dr. Harry Carnes presented this farewell address at the Annual Meeting of the Medical Society of New Jersey on April 29, 1988, at the Sheraton in East Rutherford.

This will be a bread and butter discussion of issues MSNJ has faced this year, and a brief assessment of the future as your president views it.

It has been a rather exciting year at MSNJ. We have scaled the heights (as exemplified by Assembly committee rejection of mandatory fee assignment) and plumbed the depths (as evidenced by our lack of enactment of major tort reform legislation). Yes, we have known victory and defeat, but—on balance—I feel confident that we are pursuing the proper course for our patients and our profession.

I've always been loath to take your time in discussion of general issues. However, as your president, I think I have the prerogative; indeed, the duty, to do just that. I want to convey to this house the general impressions that I've gleaned from traveling, listening, and speaking throughout this and neighboring states.

Positive areas this year for medicine are:

1) **Rejection of mandatory Medicare assignment** coupled with the statewide development of programs to assist disadvantaged senior citizens at the county level. We promised this to the Assembly Committee on Health and Human Services last May and—with statewide county support—we have fulfilled that promise.

2) **Formation of an AIDS Task Force** to provide testing guidelines and educational information for physicians throughout the state. Our entire symposium

on Sunday morning will involve AIDS. It is the number one health issue in New Jersey, and there isn't any number two. I hope each of you will make the effort to attend. A statewide governor's task force has been recommended to combat this most horrendous epidemic of our time.

3) **Substantial Medicaid fee increase** in the near future. Physician support is needed to place New Jersey in compliance with federal guidelines. Federal support (with feds supplying half the money) is mandatory for continuation of the program; thus, the promised physician fee increase. Continuing firm negotiations will be required with the Department of Health and Human Services, the Legislature, and the governor's office.

4) **Persistently increasing political involvement** of MSNJ. This political involvement enables us to do many things, not the least of which is to keep the allied health professions at bay. This large group consists of: optometrists, physical therapists, nurse practitioners, chiropractors, nurse midwives, physician assistants, and pharmacists. Some of these people want to practice medicine without going to medical school. Our legislative support allows us to make the argument that the health and well-being of the citizens of New Jersey should be in the hands of those who were given a plenary license to perform that very service: namely, the medical and osteopathic physicians of this state.

Harry M. Carnes

In my opinion, this Society possesses the talent, the resources, and most importantly—the will—to be a major political force in this state, now and in the future. We really have no alternative.

Some of the less favorable aspects of the past year have been:

1) **The inability to move significant tort reform** in the Judiciary Committee of the Senate. Our structured settlement and statute of limitations bills have languished in that committee. These bills will be reintroduced and renewed efforts made to have them passed. We were able to obtain a joint and several liability and collateral source bill.

2) **The inability of this Society to significantly increase membership** in general (and, in particular, women and other minority groups). As you may remember, it was my number one priority as I assumed this office last May. With Doctor Formica's help and committee support, we have made progress in this area—but much remains to be done. This will be an ongoing task for future administrations.

Discussing this subject, I would like to make two observations: graduates of non-U.S. schools received strong support from this House of Delegates on the issues of equality in testing, and in having their own special section in the AMA House of Delegates. Our incoming president and first vice-president are graduates of non-U.S. schools. These facts should help us in recruiting new members and it should be stated that this is not an exclusive society. Secondly, I would like to state the obvious: this Society is only as strong as its component societies. This is why I wanted every

county president recognized today. The work done throughout the state by our county leaders is enormous. Their accomplishments provide the platform on which we build at the state level. A recent example is the Senior Citizen Courtesy Program. By establishing a network of these programs throughout the state, we have blunted the thrust of that persistent, odious legislation. I do not think it is necessary or even healthy that state leaders and individual county leaders agree on every issue, but we can and must develop a consensus and then act in a manner that will be beneficial to the entire membership.

3) **SCI report** was an unexpected, bitter blow. We were castigated for a program that we had initiated and helped fund. The program was a prototype for the entire country. The negative aspects of the report led to headlines in all the major newspapers, and lead stories on every television channel and radio station in this and neighboring states. Every column and editorial was negative, without exception. Legislative leaders grabbed the story and called for public hearings. The comments always were the same—it was a case, they said, of professionals protecting each other—the conspiracy of silence goes on. Your Board of Trustees thought we were in a no-win situation, and—in an effort to defuse the issue—we chose to remain silent.

The damage done by the report was twofold: First, the commission subtly equated malpractice with incompetence, and impairment with incompetence. This, as you know, is the same story that we heard from the commissioner of insurance. It is simply not true. Some of our finest physicians have malpractice suits against them—and impaired physicians are most commonly incompetent only in the final stages of impairment. Secondly, the commission recommended mandatory reporting to the State Board of Medical Examiners for discipline, causing—in effect—what could become a police state. We considered it a dangerous recommendation. We think it would decrease the reporting of impairment drastically. Our goal is rehabilitation with confidentiality to all impaired physicians, and not public censure. Our course of action was to hire Herbert J. Stern, a prominent attorney with excellent credentials. He was a former federal prosecutor in northern New Jersey, and a federal judge for ten years. It is his task, working closely with Vincent Maressa, David Canavan, and the Board of Trustees, to present our case to the Legislature. It will be no small task, and, I think, will defy easy solution. The State Board of Medical Examiners also is actively involved in legislation on this issue. It is hoped that we can work in concert on this serious problem so that we may achieve our common goal—which is to guarantee that every citizen of New Jersey receives medical care from a competent physician.

4) **Harvard Relative Value Study** is the most important item on the medical horizon, certainly as perceived by the AMA. The AMA thought it important enough to invite the presidents and executive directors of all the state societies to Chicago some few weeks back, in order to keep everyone apprised of the situation as it now exists.

The discussion with AMA leaders in Chicago began by asking those assembled if they thought there would

be changes in reimbursement for physicians, and escalation of involvement by government and other third parties in the next five years. When we all gave a positive response, this led to the conclusion that the relative value fee may be the best and the fairest that we can get. The alternative to this is capitation and physician DRGs, which HCFA wants. HCFA prefers capitation because it controls volume. This is one item that keeps medical inflation rising at several times the national level.

The Harvard Relative Value Study was mandated by Congress, funded by HCFA, with the AMA as a subcontractor. HCFA will receive the study in July 1988, and must release it to the Congress in August 1988. At that time, it will become public information. The AMA will give the specialty societies an opportunity to assess the accuracy of the study. Hopefully, it will be presented to the AMA House of Delegates at their interim meeting in December 1988.

This study pits specialty against specialty. We must maintain unity to combat the almost certain problems that we will face. If we continue to speak and negotiate with one voice, we will be a formidable force to deal with. Divided—the government will hand us our heads. You can bet that “divide and conquer” will be the order of the day. Strong, consistent leadership will be *de rigueur*. My best guess is that the future of the AMA as preeminent spokesman for medicine may be at stake. It is my perception that the AMA thinks so, too, and that its leaders intend to be well prepared for the fight.

In conclusion, permit me to give my heartfelt thanks to the officers, Board of Trustees, all committees of the Society, the speakers, and reference committees of this convention—for the time and effort expended to make this year a success. I do not think some members realize the time and talent given freely on behalf of the

Medical Society of New Jersey, but as your president, I can tell you that it is immeasurable.

The same heartfelt thanks go to the staff. They are a talented, industrious, and pleasant group who tolerated the antics of their president with grace and good humor. I think they know I appreciated their superb efforts.

This Society should be aware of the fact that professionally we are respected, not loved, in every area of the state. I think that is high tribute, and it follows that—as your representative—I was received graciously throughout the state. I believe that we possess far more power than we at times perceive, but with that power goes responsibility to act prudently.

I want to remind you that we must remain true to our highest ideals—never better illustrated than in our present AIDS situation. If we maintain concern for patients above self, our profession will just grow in stature and get stronger.

While our patients are given competent and compassionate care—let the message ring loud and clear throughout the land—we shall not relinquish control of our profession to any group, whether it be hospital, government, entrepreneur, or anyone else. We shall fight for causes that preserve and protect medicine without apology. This noble profession is far too precious to give away.

On a personal note, I can tell you that others with far more talent than I have occupied this office in previous years, but no one ever enjoyed it more. I leave you with profound thanks for giving me the opportunity to serve.

I could paraphrase an old torch song to express my feelings:

Every day was Sunday,
every town was Paris,
and every month was May.

SLOW-K

The World's Most Popular K*

Slow-K[®]
potassium chloride
slow-release tablets
8 mEq (600 mg)

It means "dependability" in almost any language

*Based on worldwide sales data on file, CIBA Pharmaceutical Company.
Capsule or tablet slow-release potassium chloride preparations should be reserved for patients who cannot tolerate, refuse to take, or have compliance problems with liquid or effervescent potassium preparations because of reports of intestinal and gastric ulceration and bleeding with slow-release KCl preparations.

Before prescribing, please consult Brief Prescribing Information on next page.

C I B A

The World's Most Popular K

For good reasons

- **It works**—a 12-year record of efficacy¹
- **It's safe**—unsurpassed by any other KCl tablet or capsule^{2*}
- **It's acceptable vs liquids**—greater palatability, fewer GI complaints, lower incidence of nausea²
- **It's comparable to 10 mEq**—in low-dosage supplementation^{3†}
- **It's economical**—less expensive than all other leading KCl slow-release supplements on a per tablet cost to the patient¹

Slow-K[®]
potassium chloride
slow-release tablets 8 mEq (600 mg)

For patients who can't or won't tolerate liquid KCl.

*The most common adverse reactions to potassium salts are gastrointestinal side effects.

†Pooled mean serum potassium following oral administration of 30 mEq K-Tab compared to 24 mEq Slow-K in diuretic-treated hypertensives (n = 20) over 8 weeks.

Slow-Release Tablets

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE INSERT)

INDICATIONS AND USAGE

BECAUSE OF REPORTS OF INTESTINAL AND GASTRIC ULCERATION AND BLEEDING WITH SLOW-RELEASE POTASSIUM CHLORIDE PREPARATIONS, THESE DRUGS SHOULD BE RESERVED FOR THOSE PATIENTS WHO CANNOT TOLERATE OR REFUSE TO TAKE LIQUID OR EFFERVESCENT POTASSIUM PREPARATIONS OR FOR PATIENTS IN WHOM THERE IS A PROBLEM OF COMPLIANCE WITH THESE PREPARATIONS.

1. For therapeutic use in patients with hypokalemia with or without metabolic alkalosis; in digitalis intoxication and in patients with hypokalemic familial periodic paralysis.

2. For prevention of potassium depletion when the dietary intake of potassium is inadequate in the following conditions: patients receiving digitalis and diuretics for congestive heart failure, hepatic cirrhosis with ascites; states of aldosterone excess with normal renal function; potassium-losing nephropathy; and certain diarrheal states.

3. The use of potassium salts in patients receiving diuretics for uncomplicated essential hypertension is often unnecessary when such patients have a normal dietary pattern. Serum potassium should be checked periodically, however, and if hypokalemia occurs, dietary supplementation with potassium-containing foods may be adequate to control milder cases. In more severe cases supplementation with potassium salts may be indicated.

Potassium supplements are contraindicated in patients with hyperkalemia, since a further increase in serum potassium concentration in such patients can produce cardiac arrest. Hyperkalemia may complicate any of the following conditions: chronic renal failure, systemic acidosis such as diabetic acidosis, acute dehydration, extensive tissue breakdown as in severe burns, adrenal insufficiency, or the administration of a potassium-sparing diuretic (e.g., spironolactone, triamterene) (see OVERDOSAGE).

All solid dosage forms of potassium supplements are contraindicated in any patient in whom there is cause for arrest or delay in tablet passage through the gastrointestinal tract. In these instances, potassium supplementation should be with a liquid preparation. Wax-matrix potassium chloride preparations have produced esophageal ulceration in certain cardiac patients with esophageal compression due to an enlarged left atrium.

WARNINGS

Hyperkalemia (See OVERDOSAGE).
In patients with impaired mechanisms for excreting potassium, the administration of potassium salts can produce hyperkalemia and cardiac arrest. This occurs most commonly in patients given potassium by the intravenous route but may also occur in patients given potassium orally. Potentially fatal hyperkalemia can develop rapidly and be asymptomatic.

The use of potassium salts in patients with chronic renal disease, or any other condition which impairs potassium excretion, requires particularly careful monitoring of the serum potassium concentration and appropriate dosage adjustment.

Interaction With Potassium-Sparing Diuretics

Hypokalemia should not be treated by the concomitant administration of potassium salts and a potassium-sparing diuretic (e.g., spironolactone or triamterene), since the simultaneous administration of these agents can produce severe hyperkalemia.

Gastrointestinal Lesions

Potassium chloride tablets have produced stenotic and/or ulcerative lesions of the small bowel and deaths. These lesions are caused by a high localized concentration of potassium ion in the region of a rapidly dissolving tablet, which injures the bowel wall and thereby produces obstruction, hemorrhage, or perforation. Slow-K is a wax-matrix tablet formulated to provide a controlled rate of release of potassium chloride and thus to minimize the possibility of a high local concentration of potassium ion near the bowel wall. While the reported frequency of small-bowel lesions is much less with wax-matrix tablets (less than one per 100,000 patient-years) than with enteric-coated potassium chloride tablets (40-50 per 100,000 patient-years) cases associated with wax-matrix tablets have been reported both in foreign countries and in the United States. In addition, perhaps because the wax-matrix preparations are not enteric-coated and release potassium in the stomach, there have been reports of upper gastrointestinal bleeding associated with these products. The total number of gastrointestinal lesions remains approximately one per 100,000 patient-years. Slow-K should be discontinued immediately and the possibility of bowel obstruction or perforation considered if severe vomiting, abdominal pain, distention, or gastrointestinal bleeding occurs.

Metabolic Acidosis

Hypokalemia in patients with metabolic acidosis should be treated with an alkalinizing potassium salt such as potassium bicarbonate, potassium citrate, or potassium acetate.

PRECAUTIONS

General:

The diagnosis of potassium depletion is ordinarily made by demonstrating hypokalemia in a patient with a clinical history suggesting some cause for potassium depletion. In interpreting the serum potassium level, the physician should bear in mind that acute alkalosis *per se* can produce hypokalemia in the absence of a deficit in total body potassium, while acute acidosis *per se* can increase the serum potassium concentration into the normal range even in the presence of a reduced total body potassium.

Information for Patients

Physicians should consider reminding the patient of the following:

To take each dose without crushing, chewing, or sucking the tablets.

To take this medicine only as directed. This is especially important if the patient is also taking both diuretics and digitalis preparations.

To check with the physician if there is trouble swallowing tablets or if the tablets seem to stick in the throat.

To check with the doctor at once if tarry stools or other evidence of gastrointestinal bleeding is noticed.

Laboratory Tests

Regular serum potassium determinations are recommended. In addition, during the treatment of potassium depletion, careful attention should be paid to acid-base balance, other serum electrolyte levels, the electrocardiogram, and the clinical status of the patient, particularly in the presence of cardiac disease, renal disease, or acidosis.

Drug Interactions

Potassium-sparing diuretics: see WARNINGS.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies in animals have not been performed.

Pregnancy Category C

Animal reproduction studies have not been conducted with Slow-K. It is also not known whether Slow-K can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Slow-K should be given to a pregnant woman only if clearly needed.

Nursing Mothers

The normal potassium ion content of human milk is about 13 mEq/L. It is not known if Slow-K has an effect on this content. Caution should be exercised when Slow-K is administered to a nursing woman.

Pediatric Use

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

One of the most severe adverse effects is hyperkalemia (see CONTRAINDICATIONS, WARNINGS, and OVERDOSAGE). There also have been reports of upper and lower gastrointestinal conditions including obstruction, bleeding, ulceration, and perforation (see CONTRAINDICATIONS and WARNINGS); other factors known to be associated with such conditions were present in many of these patients.

The most common adverse reactions to oral potassium salts are nausea, vomiting, abdominal discomfort, and diarrhea. These symptoms are due to irritation of the gastrointestinal tract and are best managed by taking the dose with meals or reducing the dose.

Skin rash has been reported rarely.

OVERDOSAGE

The administration of oral potassium salts to persons with normal excretory mechanisms for potassium rarely causes serious hyperkalemia. However, if excretory mechanisms are impaired or if potassium is administered too rapidly intravenously, potentially fatal hyperkalemia can result (see CONTRAINDICATIONS and WARNINGS). It is important to recognize that hyperkalemia is usually asymptomatic and may be manifested only by an increased serum potassium concentration (6.5-8.0 mEq/L) and characteristic electrocardiographic changes (peaking of T waves, loss of P wave, depression of S-T segment, and prolongation of the Q-T interval). Late manifestations include muscle paralysis and cardiovascular collapse from cardiac arrest (9-12 mEq/L).

Treatment measures for hyperkalemia include the following: (1) elimination of foods and medications containing potassium and of potassium-sparing diuretics; (2) intravenous administration of 300-500 mEq/hr of 10% dextrose solution containing 10-20 units of insulin per 1,000 ml; (3) correction of acidosis, if present, with intravenous sodium bicarbonate; (4) use of exchange resins, hemodialysis, or peritoneal dialysis.

In treating hyperkalemia in patients who have been stabilized on digitals, too rapid a lowering of the serum potassium concentration can produce digitalis toxicity.

DOSE AND ADMINISTRATION

The usual dietary intake of potassium by the average adult is 40-80 mEq per day. Potassium depletion sufficient to cause hypokalemia usually requires the loss of 200 or more mEq of potassium from the total body store. Dosage must be adjusted to the individual needs of each patient but is typically in the range of 20 mEq per day for the prevention of hypokalemia to 40-100 mEq or more per day for the treatment of potassium depletion. Large numbers of tablets should be given in divided doses.

Note: Slow-K slow-release tablets must be swallowed whole and never crushed, chewed, or sucked.

HOW SUPPLIED

Tablets—600 mg of potassium chloride (equivalent to 8 mEq) round, buff colored, sugar-coated (imprinted Slow-K)

Bottles of 100 NDC 0083-0165-30

Bottles of 1000 NDC 0083-0165-40

Consumer Pack—One Unit

12 Bottles—100 tablets each NDC 0083-0165-65

CLINICAL CORRELATES AND DIAGNOSTICS IN CAROTID VASCULAR DISEASE

ROBERT A. BAZEWICZ, M.D., LARRY B. SANDLER, JOSEPH D. COHN, M.D., LIVINGSTON*

Results of noninvasive cerebrovascular studies were compared to those of contrast imaging of the internal carotid artery. Doppler spectral analysis was as accurate as contrast angiography and more accurate than digital subtraction angiography in assessing the extent of internal carotid artery stenosis.

Until recently, there was no question as to the need for angiography in the preoperative evaluation of patients undergoing carotid endarterectomy. Even with refinements in the techniques of standard contrast arteriography and the development of digital subtraction angiography, contrast imaging of the carotid vasculature carries a recognized overall morbidity of 5 to 15 percent with neurologic sequelae making up about 1 percent of the overall morbidity.¹⁻⁴ The development of noninvasive vascular assessment utilizing Doppler spectral analysis, oculoplethysmography-Gee (OPG), and supraorbital bidirectional Doppler flow studies has led to increasingly accurate evaluations of stenotic lesions of the internal carotid artery (ICA).⁵⁻⁸ B-mode real-time imaging also has emerged as a reliable means of assessing stenotic lesions of the carotid arteries.⁹

Utilizing a multimodality approach in evaluating carotid arterial disease, carotid endarterectomy has been performed in a select group of patients without the use of preoperative contrast angiography.^{9,10} This concept prompted us to correlate the results of the various noninvasive vascular studies with symptomatology and angiography.

METHODS AND MATERIALS

Noninvasive carotid vascular studies consisting of

supraorbital bidirectional Doppler flow analysis, ocular pneumoplethysmography-Gee, B-mode ultrasound imaging, and Doppler spectral analysis were carried out on 366 vessels examined consecutively over an eight-month interval in the noninvasive Vascular Laboratory at Saint Barnabas Medical Center in Livingston. Cerebrovascular symptomatology and findings on both conventional and digital subtraction angiography were compared against data obtained by spectral analysis (SA). Patient referrals for noninvasive carotid study were for asymptomatic bruits, nonlateralizing neurologic symptoms, transient ischemic attacks, and lateralizing neurologic deficits.

Using a 5 MHz transducer with the signal displayed on a real-time spectrum analyzer and a B-mode ultrasonic imager,** the degree of internal carotid artery stenosis was assessed following the guidelines set forth by Strandness.⁵ Supraorbital bidirectional Doppler flow analysis† was performed on 272 of the vessels

studied.^{11,12} Two-hundred ninety-five vessels were studied by ocular pneumoplethysmography.* The methods of examination and significance of the results were those outlined by Gee and coworkers.^{13,14}

Contrast imaging was performed on 63 of the vessels within one month of the noninvasive evaluation. Conventional biplanar arteriography was performed on 53 of the vessels.** Intra-arterial digital subtraction arteriography (IADSA) was performed on 10 of the vessels.† Percent linear stenosis was determined from these contrast images using the following formula: % Stenosis = D-d/D (100), where "D" represents the averaged diameter of the first normal portion of the internal carotid artery distal to the stenotic lesion and "d" represents the averaged diameter of the area of greatest stenosis measured on a lateral and an oblique view of the vessel. All carotid contrast imagings were performed at the discretion of the referring physician and, therefore, do not represent a randomized population. The angiograms were reviewed and interpreted by a radiologist as well as the authors who were unaware of the results of the noninvasive studies. Significant discrepancies between the noninvasive results and those of contrast arteriography and digital arteriography then were evaluated retrospectively.

RESULTS

An audible neck bruit was noted in 145 of the 366 vessels evaluated and, when the completely occluded vessels were excluded, predicted the presence of ICA stenosis greater than 50 percent by SA (Tables 1 and 2) with a 71 percent sensitivity and a 67 percent specificity for an overall accuracy of 67 percent (*P*<0.001). A history of lateralizing sensory and motor symptoms,

amaurosis fugax, or syncope was obtained from 195 patients in the study population but did not correlate with ICA stenosis of greater than 50 percent.

OPG was compared to Doppler spectral analysis in 295 vessels with results appearing in Table 3. OPG was found to be a sensitive indicator of ICA stenosis greater than 80 percent by SA, sensitivity 100 percent, specificity 88 percent, with an overall accuracy of 88 percent (*P*<0.001). Supraorbital bidirectional Doppler flow analysis (SOF) was compared to SA in 272 vessels and the results appear in Table 4. SOF was a less sensitive (64 percent) indicator of stenotic disease greater than 80 percent than was OPG (100 percent); however, it maintained a higher specificity (95 percent) for an overall accuracy of 94 percent in predicting stenosis greater than 80 percent (*P*<0.001).

The results of selective contrast arteriography correlated well with those of SA in 53 vessels and appear in Table 5. The correlation coefficient of SA compared to contrast arteriography was 0.95 (*P*<<0.0001). No occluded vessels were misinterpreted by Doppler spectral analysis. Two contrast angiographic studies were misinterpreted on initial reading; however, retrospective review demonstrated the presence and degree of stenosis predicted by SA. These cases are cited below. Digital subtraction angiography was performed on ten vessels (Table 6) and did not correlate as well with the results of SA as did the selective contrast angiographic studies (*R*=0.53, *P*<0.20 versus *R*=0.95 *P*<<0.0001). There were no neurologic or renal complications among these angiographically studied patients.

CASE REPORTS

A 76-year-old male presented with a left carotid bruit and an episode of expressive aphasia occurring two weeks prior to study and lasting 24 to 36 hours, with subsequent complete resolution. On physical examination, he exhibited a monophasic systolic left carotid bruit and mild hypertensive fundoscopic changes. Noninvasive vascular studies revealed an 80 to 99 percent left internal carotid artery stenotic lesion on SA with SOF reversal and an ipsilateral 10 mm Hg pressure deficit on OPG; B-mode imaging was unable to locate a plaque to explain the above findings, but did note a tortulous ICA. The initial reading on contrast arteriography was "normal study"; however, retrospective review of the films, with knowledge of the noninvasive results revealed a 90 percent occluding "web" in the midpoint of the tortuous vessel. This was

Figure 1—Selective carotid arteriogram demonstrates a tortuous left internal carotid artery. A nearly occluding internal carotid web (arrow) is visualized only on this oblique view.

initially misinterpreted due to the column of contrast in the external carotid artery overlying the point of stenosis on all but the oblique views (Figure 1).

A 68-year-old female presented with bilateral neck bruits, vague history of lightheadedness, and left-sided numbness and weakness of indeterminate onset and chronicity. Examination demonstrated soft bilateral systolic carotid bruits. Eye fields revealed changes consistent with long-standing hypertension and previous right surgical aphakia. Her heart rhythm was regular and there was no murmur. Noninvasive studies of both carotid arteries revealed: right ICA 0 to 15 percent stenosis by SA with normal SOF and an OPG pressure of 133 mm Hg; left ICA 50 to 79 percent stenosis by SA with normal SOF and OPG pressure of 124 mm Hg. She underwent arch and carotid contrast imaging using IADSA to reduce the contrast load, and was found to have no demonstrable stenosis. Because of poor resolution, selective carotid arteriography (CA) of both carotid arteries was performed and revealed a 74 percent stenosis high in the left ICA which, even in retrospect, could not be found on the IADSA studies. The right ICA had a 15 percent stenotic lesion at the bifurcation of the common carotid artery (Figure 2).

DISCUSSION

The significance and management of asymptomatic carotid bruits remain controversial issues. An increased risk of stroke has been ascribed to patients with asymptomatic bruits and angiographically documented stenosis,¹⁵ yet many patients with asymptomatic bruits are not at increased risk for stroke from their carotid disease.^{16,17} Arteriographic demonstration of a flow significant stenotic lesion has been shown to

Figure 2—Selective left carotid arteriogram illustrates a high-grade stenosis of the upper cervical portion of the internal carotid artery (arrow). This stenosis was not demonstrated on an intra-arterial digital subtraction angiogram.

place one at an increased risk for stroke;¹⁵ however, arteriography is not without complications.^{1,4} Contrast-induced renal failure is one of the most important complications of conventional arteriography and occurs in approximately 1 percent of all patients so studied, an increased incidence being noted in patients with diabetes, chronic renal insufficiency, hypertension, and extracellular volume depletion.^{18,19} Moreover, in diabetics, the incidence is doubled and if the creatinine level is above 2 mg/dl, the risk of acute renal failure may be as high as 33 percent.¹⁹ Neurologic sequelae occur in 0.5 to 1.0 percent of most reported series. Digital subtraction angiography utilizes small amounts of contrast material, thereby lowering this risk, and has been thought to provide images comparable in clarity to conventional angiography.²⁰ Others report poor resolution and a tendency to underestimate the severity of the carotid disease utilizing IADSA.²¹ Our experience favors the findings of the latter, i.e. that the severity of the disease tends to be underestimated. However, it should be noted that this conclusion is based on images obtained from early imaging systems. The newer, state-of-the-art, digital subtraction imaging systems appear to provide studies with far better resolution and it remains to be seen if these studies will correlate as well with SA as does conventional arteriography.

With contrast arteriography as a standard for comparison, SA provided hemodynamic information which predicted the extent of ICA stenosis with a correlation coefficient of 0.95. This is similar to the results of other reported series with a correlation of 85 to 95 percent.^{9,21,22} SOF and OPG were less accurate in predicting the degree of stenosis, but OPG detected all steno-

ses greater than 80 percent in our series. It is significant to note that no completely occluded vessel was misinterpreted using this combined approach, and no vessels with high-grade stenosis were mislabelled as 100 percent occluded.

Our results demonstrate that most cases involving flow significant stenosis of the surgically accessible portion of the internal carotid artery can be reliably detected by noninvasive vascular testing. The presence of an audible neck bruit, whether symptomatic or not, accurately reflected stenosis greater than 50 percent while subjective symptoms did not. Since SA, OPG, and SOF all quantitate the extent of disease based on alterations in flow dynamics within the carotid artery, it stands to reason that a bruit (the result of a flow significant lesion) should herald a stenotic lesion and be able to be detected by these means. Of significance, also, is the ability to distinguish between stenoses of the internal carotid artery from the external and common carotid arteries. Subjective symptoms, on the other hand, may be the result of one of a myriad of causes, only a few of which involve extracranial carotid arterial disease. Symptoms, therefore, in the absence of a bruit did not correlate well with any carotid arterial disease demonstrable by these studies.

B-mode imaging is utilized for locating stenotic lesions; however, in a series of 89 vessels in which images from B-mode ultrasonography were compared to those specimens obtained at carotid endarterectomy, O'Donnell and coworkers demonstrated that B-mode imaging can provide an accurate picture of stenotic lesions and also define the characteristics of ulcerated plaques.²³ We have not found B-mode ultrasonography to be a sensitive means of defining the anatomy of ulcerated plaques because adequate resolution of the vessel's medial wall has been a limiting factor. With only sector scanning available, we still favor contrast imaging over noninvasive studies in the evaluation of nonstenotic carotid arterial lesions. SA, SOF, OPG, and B-mode imaging in combination, however, made the predictive value of our noninvasive studies sufficiently accurate to preclude the need for contrast imaging in assessing stenotic lesions greater than 80 percent. Both cited cases of discrepancies between contrast imaging and noninvasive studies involving stenotic lesions of the ICA were diagnosed by the noninvasive vascular studies but not initially appreciated on contrast angiography. It was only after the information from the noninvasive studies was reviewed that the lesions were noted.

CONCLUSIONS

Audible neck bruits more accurately reflect the presence of ICA stenosis than does the presence of subjective neurologic symptoms. Spectral analysis is an accurate means of measuring the extent of stenotic lesions in the internal carotid artery and correlates well with selective biplanar contrast arteriographic studies. IADSA underestimates the extent of stenoses and correlates poorly with the findings of SA. Nonstenotic lesions were most reliably assessed with contrast imaging. The combined use of OPG and SA may be sufficient to reliably document ICA stenosis greater than 80 percent and preclude the need for diagnostic contrast imaging of such lesions.

Spare your patients the rigors of
dietary K⁺ supplementation.

DYAZIDE[®]

25mg Hydrochlorothiazide/50mg Triamterene/SKF

Effective antihypertensive*
therapy...without
the bananas

DAW

'DYAZIDE' AS WRITTEN.

* Not for initial therapy. See brief summary.

Before prescribing, see complete
prescribing information in
SK&F CO. literature or PDR.
The following is a brief summary.

* WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or

without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin (ACTH)). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The

following may occur: transient elevated BUN or creatinine or both; hyperglycemia and glycosuria (diabetic insulin requirements may be altered); hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak[™] unit-of-use bottles of 100.

AEROALLERGEN PREVALENCE IN NEW JERSEY

LEONARD BIELORY, M.D., AND CLEMENCIA DIAZ, R.T., NEWARK*

Aeroallergens cause IgE-mediated disorders and their presence correlates with the development of many allergic symptoms. In New Jersey, tree, grass, and weed pollens are released sequentially from February through November, while mold antigens are present from the winter thaw through the first frost.

Type I (IgE-mediated) hypersensitivity reactions which are manifested in allergic asthma or rhinoconjunctivitis develop within minutes after exposure to an antigen such as pollen or mold particles.^{1,2} Pollen, a fine powder of airborne allergens (aeroallergens), are male reproductive structures of seed-bearing plants.³ The plants, which use the wind as the means for fertilization, usually produce extremely large volumes of pollen and, consequently, are a source of a significant quantity of inhaled antigens.^{3,4} Therefore, the Division of Allergy and Immunology, as part of a national survey under the auspices of the American Academy of Allergy and Immunology (AAAAI)—Pollen and Mold Committee and sponsored by the National Institutes of Health, National Institute of Allergy and Infectious Diseases, studied the prevalence of aeroallergens in northern New Jersey for 1987 at UMDNJ-University Hospital/New Jersey Medical School.

METHODS

Aeroallergen collection, with the AAAI-approved rotating air impactor (Rotorod, Ted Brown Associates, California) were evaluated daily beginning March 1, 1987. Lucite rods coated with silicone grease were rotated for 30 seconds every ten minutes at a fixed speed during a 24-hour interval. The rods were removed,

stained with Hansel's stain, and the pollen and mold particles counted over a fixed distance. The results were tabulated and reported as the average number of pollen or molds particles per cubic meter of air sampled.^{5,6}

A total count of less than 100 is considered low; 100 to 500 is moderate; 500 to 1,000 is high; and greater than 1,000 is extremely high. A pollen count for a specific pollen in excess of 10 per cubic meter is considered significant.

The pollen counts were performed daily at 8:00 A.M., Monday through Friday. The examination performed on Monday reflected the total collection from Friday (8:00 A.M.) through the weekend until Monday (8:00 A.M.). The Monday count, therefore, was an average of three days (Friday, Saturday, and Sunday) and was divided by three to give the average daily count for the weekend.

RESULTS

In general, pollination of the major plants occurred in sequence: trees in the late winter through spring,

*Dr. Bielory is director and Ms. Diaz is medical technologist for the Division of Allergy and Immunology, UMDNJ-New Jersey Medical School, Newark. Correspondence may be addressed to Dr. Bielory, UMDNJ-New Jersey Medical School, Department of Medicine, 185 South Orange Avenue, I-512, Newark, NJ 07103-2757.

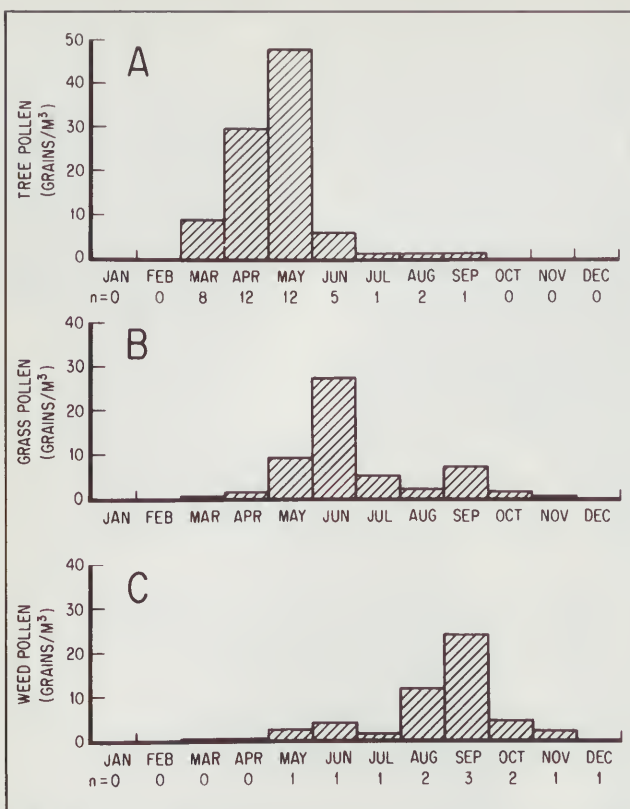

Figure 1—Average pollen counts are reported for trees (A), grasses (B), and weeds (C) during each month. Pollination of the trees, grasses, and weeds appeared sequentially from February through November with overlap between the species. (Below each month, N = number of different species included in the average monthly tree and weed counts. Grass species were not differentiated on their morphology.)

Figure 2—Average mold particles reported during each month. Mold growth increased after the winter thaw and persisted through the first frost (March-November).

grasses in the spring through early summer, and weeds in the summer through early fall. The release of mold spores was noted as early as the first winter thaw, when moisture permitted mold growth, through the first frost.

Trees started to pollinate by the beginning of March and continued through the beginning of May (Figure 1A). The major tree pollens were from the elm trees which appeared first, and then later in the year by the birch trees.

Grasses started to pollinate during the middle of March and continued through the beginning of July. A second peak in pollen release occurred during September (Figure 1B). Types of grasses were not identified.

Weeds started to pollinate in the middle of May and continued through October. The major weed pollens

identified were from *Plantago*, *Chenopodium*, and *Ambrosia* (ragweed) species (Figure 1C). Specifically, ragweed pollination began in the middle of August and continued through the beginning of October.

Mold spores initially were recorded at the middle of the tree pollinating season and continued throughout the year until the late fall. Mold spores exceeded pollen particles 10- to 100-fold (Figure 2).

DISCUSSION

Aeroallergens are relatively large and complex materials, e.g. pollens, molds, house dust mites, animal dander, that are capable of inducing a type I IgE-mediated hypersensitivity (allergic) reaction leading to the activation of mast cells and the subsequent release of inflammatory mediators in susceptible persons.¹⁻⁴ These particles contain many molecular components and only some are antigenic. These antigenic portions are mainly proteins with a molecular weight of 3,000-40,000 daltons and are 2 to 60 μm in diameter.^{3,4,7} The majority of these particles come into direct contact with the ocular, nasal, and pharyngeal surfaces, while only 80 percent of those particles less than 10 μm reach the bronchial mucosa.^{4,8} Asthma may be caused by the direct contact of the smaller particles or from the stimulation of a bronchial reflex by nasopharyngeal receptors.⁹

Previously, physicians treating patients with allergic conditions in New Jersey had to rely on general botanical information of the known flora found in this geographical setting. However, we attempted to document the actual types and timing of pollens found in the New Jersey environment. Although pollens can be obtained from a variety of plant life, not all pollen grains appear to produce an allergic response.^{3,4} The pollen-producing plants which are most troublesome in inducing allergies can be classified into three main categories: grasses, weeds, and trees.^{3,4} The amount of pollen does not appear to be the major factor of an allergic response since 100- to 1,000-fold more pine pollen is released than ragweed pollen; yet over 75 percent of allergic patients are sensitive to ragweed.^{3,4,10} In the United States, the grasses and the weeds (ragweed) are major culprits in the production of allergies: rhinoconjunctivitis and extrinsic asthma.^{3,4,11} Correlation of particle counts with clinical symptoms on a given day must be cautiously interpreted since allergic patients have different levels of sensitivity.⁴ This study was undertaken to determine the prevalence of such clinically significant aeroallergens in order to better assist the New Jersey physician in the education and treatment of these allergic patients.

A number of methods, gravitational or volumetric, are available to identify and quantify the various pollens and molds released into the atmosphere.^{4,6} Large particles (greater than 20 μm in diameter) are adequately measured by gravitational methods, but for research purposes, the more accurate volumetric techniques have been employed. Therefore, the American Academy of Allergy and Immunology—Pollen and Mold Committee approved the volumetric technique, rotating air impactor (Rotorod), for their national survey of aeroallergens.

The pollen of anemophilous, wind-pollinating, as compared to the entomophilous, insect-pollinating,

trees are the principal causes of respiratory allergy during the late winter and spring.^{3,4} Each tree genus produces pollen morphologically distinct from that from any other genus.^{3,4} In New Jersey, the predominant genera are elm (*Ulmus* sp.) and birch (*Betula* sp.). In general, the pollinating period for each species was several weeks.

Grass pollen are the principal causes of allergic symptoms during the spring and early summer.^{3,4} In New Jersey, there also appears to be a second pollinating season at the end of the summer in September. It is difficult to distinguish grass pollen solely on the basis of morphology.^{3,4} Consequently, the importance of individual species is based on the total grass-pollen counts and correlated with the regional prevalence of individual grass species. In New Jersey, blue grass, orchard grass, timothy grass, and red top grass predominate. The frequency and severity of allergic symptoms to grass pollens ranks second as compared to weeds in the United States.^{3,4} In other parts of the world it is the leading offender.^{3,4}

Although there is an extensive list of plants that can be considered weeds, ragweed (*Ambrosia* sp.) is the single most important cause, quantitatively and qualitatively, of seasonal allergic rhinitis (hay fever) in the United States.^{3,4} In New Jersey, ragweed pollinated in the late summer (mid-August) through early fall. Other weeds identified were lamb's quarters (*Chenopodium* sp.), cocklebur (*Xanthium* sp.), plantain (*Plantago* sp.), and dock sorrel (*Rumex* sp.).

Mold sensitivity in allergic patients is characterized by sporadic exacerbations during periods of maximal growth or concentrated exposures. As noted in increased asthmatic episodes in patients with allergic bronchopulmonary aspergillosis, as well as other allergic complaints in patients raking leaves, or visiting a farm, molds exist in almost every environment.¹² Their airborne presence was noted during the initial exposure of moisture during the winter thaw and continued through the first frost at which time the molds sporulate, producing a large airborne antigen load. However, molds may be found in many homes causing perennial allergic symptoms.¹³

CONCLUSION

The primary treatment modalities for allergic reactions are avoidance, pharmacotherapy, and immunotherapy (hyposensitization). Immunotherapy commonly is utilized in patients with unavoidable sustained

exposures, and brings symptomatic relief to over 80 percent of patients.^{11,14-17} The antigens used in the immunotherapy treatments are guided by the positive immediate skin tests and the prevalence of specific allergens in the immediate environment during the height of the patients' symptoms.

and PREMARIN[®]

**Proven benefits beyond relief
of vasomotor symptoms**

**No other estrogen proven
effective for osteoporosis**

Only conjugated estrogens tablets have established efficacy in both osteoporosis¹ and vasomotor symptoms* at 0.625 mg/day. No other estrogen, oral or transdermal, has established clinical evidence or minimum effective dose in both indications.

No estrogen proven safer

PREMARIN is the most extensively tested estrogen, with an unsurpassed record of long-term safety. And clinical evidence shows a significantly reduced risk of endometrial hyperplasia when cycled with a progestin.²

PREMARIN[®]
(conjugated estrogens tablets)

Most trusted for more reasons

*PREMARIN is indicated for moderate-to-severe vasomotor symptoms.

Please see following page for brief summary
of prescribing information.

For moderate-to-severe vasomotor symptoms and for osteoporosis

PREMARIN® (conjugated estrogens tablets)

The appearance of these tablets is a trademark of Ayerst Laboratories.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION AND PATIENT INFORMATION, SEE PACKAGE CIRCULARS.)

PREMARIN® Brand of conjugated estrogens tablets, USP
PREMARIN® Brand of conjugated estrogens Vaginal Cream, in a nonliquefying base

1. ESTROGENS HAVE BEEN REPORTED TO INCREASE THE RISK OF ENDOMETRIAL CARCINOMA. Three independent, case-controlled studies have reported an increased risk of endometrial cancer in postmenopausal women exposed to exogenous estrogens for more than one year. This risk was independent of the other known risk factors for endometrial cancer. These studies are further supported by the finding that incidence rates of endometrial cancer have increased sharply since 1969 in eight different areas of the United States with population-based cancer reporting systems, an increase which may be related to the rapidly expanding use of estrogens during the last decade. The three case-controlled studies reported that the risk of endometrial cancer in estrogen users was about 4.5 to 13.9 times greater than in nonusers. The risk appears to depend on both duration of treatment and on estrogen dose. In view of these findings, when estrogens are used for the treatment of menopausal symptoms, the lowest dose that will control symptoms should be utilized and medication should be discontinued as soon as possible. When prolonged treatment is medically indicated, the patient should be reassessed on at least a semi-annual basis to determine the need for continued therapy. Although the evidence must be considered preliminary, one study suggests that cyclic administration of low doses of estrogen may carry less risk than continuous administration; it therefore appears prudent to utilize such a regimen. Close clinical surveillance of all women taking estrogens is important. In all cases of undiagnosed persistent or recurring abnormal vaginal bleeding, adequate diagnostic measures should be undertaken to rule out malignancy. There is no evidence at present that "natural" estrogens are more or less hazardous than "synthetic" estrogens at equi-estrogenic doses.

2. ESTROGENS SHOULD NOT BE USED DURING PREGNANCY. The use of female sex hormones, both estrogens and progestogens, during early pregnancy may seriously damage the offspring. It has been shown that females exposed in utero to diethylstilbestrol, a nonsteroidal estrogen, have an increased risk of developing, in later life, a form of vaginal or cervical cancer that is ordinarily extremely rare. This risk has been estimated as not greater than 4 per 1,000 exposures. Furthermore, a high percentage of such exposed women (from 30% to 90%) have been found to have vaginal adenosis, epithelial changes of the vagina and cervix. Although similar data are not available with the use of other estrogens, it cannot be presumed they would not induce similar changes. Several reports suggest an association between intrauterine exposure to female sex hormones and congenital anomalies, including congenital heart defects and limb-reduction defects. One case-controlled study estimates a 4.7-fold increased risk of limb-reduction defects in infants exposed in utero to sex hormones (oral contraceptives, hormone withdrawal tests for pregnancy, or attempted treatment for threatened abortion). Some of these exposures were very short and involved only a few days of treatment. The data suggest that the risk of limb-reduction defects in exposed fetuses is somewhat less than 1 per 1,000. In the past, female sex hormones have been used during pregnancy in an attempt to treat threatened or habitual abortion. There is considerable evidence that estrogens are ineffective for these indications, and there is no evidence from well-controlled studies that progestogens are effective for these uses. If PREMARIN is used during pregnancy, or if the patient becomes pregnant while taking this drug, she should be apprised of the potential risks to the fetus, and the advisability of pregnancy continuation.

DESCRIPTION: PREMARIN (conjugated estrogens, USP) contains a mixture of estrogens, obtained exclusively from natural sources, blended to represent the average composition of material derived from pregnant mares' urine. It contains estrone, equilin, and 17 α -dihydroequilin, together with smaller amounts of 17 α -estradiol, equilin, and 17 α -dihydroequilin as salts of their sulfate esters. Tablets are available in 0.3 mg, 0.625 mg, 0.9 mg, 1.25 mg, and 2.5 mg strengths of conjugated estrogens. Cream is available as 0.625 mg conjugated estrogens per gram.

INDICATIONS AND USAGE: PREMARIN (conjugated estrogens tablets, USP): Moderate-to-severe vasomotor symptoms associated with the menopause. (There is no evidence that estrogens are effective for nervous symptoms or depression without associated vasomotor symptoms and they should not be used to treat such conditions.) Osteoporosis (abnormally low bone mass). Atrophic vaginitis. Kraurosis vulvae. Female castration. PREMARIN (conjugated estrogens) Vaginal Cream is indicated in the treatment of atrophic vaginitis and kraurosis vulvae.

PREMARIN HAS NOT BEEN SHOWN TO BE EFFECTIVE FOR ANY PURPOSE DURING PREGNANCY AND ITS USE MAY CAUSE SEVERE HARM TO THE FETUS (SEE BOXED WARNING).

Concomitant Progestin Use: The lowest effective dose appropriate for the specific indication should be utilized. Studies of the addition of a progestin for 7 or more days of a cycle of estrogen administration have reported a lowered incidence of endometrial hyperplasia. Morphological and biochemical studies of the endometrium suggest that 10 to 13 days of progestin are needed to provide maximal maturation of the endometrium and to eliminate any hyperplastic changes. Whether this will provide protection from endometrial carcinoma has not been clearly established. There are possible additional risks which may be associated with the inclusion of progestin in estrogen replacement regimens. (See PRECAUTIONS.) The choice of progestin and dosage may be important; product labeling should be reviewed to minimize possible adverse effects.

CONTRAINDICATIONS: Estrogens should not be used in women (or men) with any of the following conditions: 1. Known or suspected cancer of the breast except in appropriately selected patients being treated for metastatic disease. 2. Known or suspected estrogen-dependent neoplasia. 3. Known or suspected pregnancy (See Boxed Warning). 4. Undiagnosed abnormal genital bleeding. 5. Active thrombophlebitis or thromboembolic disorders. 6. A past history of thrombophlebitis, thrombosis, or thromboembolic disorders associated with previous estrogen use (except when used in treatment of breast or prostatic malignancy).

WARNINGS: Estrogens have been reported to increase the risk of endometrial carcinoma (See Boxed Warning). However, a recent large, case-controlled study indicated no increase in risk of breast cancer in postmenopausal women. A recent study has reported a 2- to 3-fold increase in the risk of surgically confirmed gallbladder disease in women receiving postmenopausal estrogens.

Adverse effects of oral contraceptives may be expected at the larger doses of estrogen used to treat prostatic or breast cancer or postpartum breast engorgement; it has been shown that there is an increased risk of thrombosis in men receiving estrogens for prostatic cancer and women for postpartum breast engorgement. Users of oral contraceptives have an increased risk of diseases, such as thrombophlebitis, pulmonary embolism, stroke, and myocardial infarction. Cases of retinal thrombosis, mesenteric thrombosis, and optic neuritis have been reported in oral contraceptive users. An increased risk of postsurgery thromboembolic complications has also been reported in users of oral contraceptives. If feasible, estrogen should be discontinued at least 4 weeks before surgery of the type associated with an increased risk of thromboembolism, or during periods of prolonged immobilization. Estrogens should not be used in persons with active thrombophlebitis, thromboembolic disorders, or in persons with a history of such disorders in association with estrogen use. They should be used with caution in patients with cerebral vascular or coronary artery disease. Large doses (5 mg conjugated estrogens per day), comparable to those used to treat cancer of the prostate and breast, have been shown to increase the risk of nonfatal myocardial infarction, pulmonary embolism, and thrombophlebitis. When doses of this size are used, any of the thromboembolic and thrombotic adverse effects should be considered a clear risk.

For atrophic vaginitis

PREMARIN® (conjugated estrogens)

Vaginal Cream
0.625 mg/g

Benign hepatic adenomas should be considered in estrogen users having abdominal pain and tenderness, abdominal mass, or hypovolemic shock. Hepatocellular carcinoma has been reported in women taking estrogen-containing oral contraceptives. Increased blood pressure may occur with use of estrogens in the menopause and blood pressure should be monitored with estrogen use. A worsening of glucose tolerance has been observed in patients on estrogen-containing oral contraceptives. For this reason, diabetic patients should be carefully observed. Estrogens may lead to severe hypercalcemia in patients with breast cancer and bone metastases.

PRECAUTIONS: Physical examination and a complete medical and family history should be taken prior to the initiation of any estrogen therapy with special reference to blood pressure, breasts, abdomen, and pelvic organs, and should include a Papanicolaou smear. As a general rule, estrogen should not be prescribed for longer than one year without another physical examination being performed. Conditions influenced by fluid retention, such as asthma, epilepsy, migraine, and cardiac or renal dysfunction, require careful observation. Certain patients may develop manifestations of excessive estrogenic stimulation, such as abnormal or excessive uterine bleeding, mastodynia, etc. Prolonged administration of unopposed estrogen therapy has been reported to increase the risk of endometrial hyperplasia in some patients. Oral contraceptives appear to be associated with an increased incidence of mental depression. Patients with a history of depression should be carefully observed. Pre-existing uterine leiomyomata may increase in size during estrogen use. The pathologist should be advised of estrogen therapy when relevant specimens are submitted. It jaundice develops in any patient receiving estrogen, the medication should be discontinued while the cause is investigated. Estrogens should be used with care in patients with impaired liver function, renal insufficiency, metabolic bone diseases associated with hypercalcemia or in young patients in whom bone growth is not yet complete. It concomitant progestin therapy is used, potential risks may include adverse effects on carbohydrate and lipid metabolism.

The following changes may be expected with larger doses of estrogen:

- Increased subfibrinogen retention.
- Increased prothrombin and factors VII, VIII, IX, and X; decreased antithrombin 3; increased norepinephrine-induced platelet aggregability.
- Increased thyroid binding globulin (TBG) leading to increased circulating total thyroid hormone, as measured by PBI, T_4 by column, or T_4 by radioimmunoassay. Free T_3 resin uptake is decreased, reflecting the elevated TBG; free T_4 concentration is unaltered.
- Impaired glucose tolerance.
- Decreased pregnandiol excretion.
- Reduced response to meperidine.
- Reduced serum folate concentration.
- Increased serum triglyceride and phospholipid concentration.

As a general principle, the administration of any drug to nursing mothers should be done only when clearly necessary since many drugs are excreted in human milk.

Long-term, continuous administration of natural and synthetic estrogens in certain animal species increases the frequency of carcinomas of the breast, cervix, vagina, and liver. However, in a recent, large case-controlled study of postmenopausal women there was no increase in risk of breast cancer with use of conjugated estrogens.

ADVERSE REACTIONS: The following have been reported with estrogenic therapy, including oral contraceptives: breakthrough bleeding, spotting, change in menstrual flow; dysmenorrhea; premenstrual-like syndrome; amenorrhea during and after treatment; increase in size of uterine fibromyoma; vaginal candidiasis; change in cervical erosion and in degree of cervical secretion; cystitis-like syndrome; tenderness, enlargement, secretion (of breasts); nausea, vomiting, abdominal cramps, bloating; cholestatic jaundice; chloasma or melasma which may persist when drug is discontinued; erythema multiforme; erythema nodosum; hemorrhagic eruption; loss of scalp hair; hirsutism; steepening of corneal curvature; intolerance to contact lenses; headache, migraine, dizziness, mental depression, chorea; increase or decrease in weight; reduced carbohydrate tolerance; aggravation of porphyria; edema; changes in libido.

ACUTE OVERDOSEAGE: May cause nausea, and withdrawal bleeding may occur in females.

DOSEAGE AND ADMINISTRATION:

PREMARIN® Brand of conjugated estrogens tablets, USP

1. *Given cyclically for short-term use only.* For treatment of moderate-to-severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with the menopause (0.3 mg to 1.25 mg or more daily). The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible. Administration should be cyclic (eg, three weeks on and one week off). Attempts to discontinue or taper medication should be made at three- to six-month intervals.

2. *Given cyclically:* Osteoporosis. Female castration. Osteoporosis — 0.625 mg daily. Administration should be cyclic (eg, three weeks on and one week off). Female castration — 1.25 mg daily, cyclically. Adjust upward or downward according to response of the patient. For maintenance, adjust dosage to lowest level that will provide effective control.

Patients with an intact uterus should be monitored for signs of endometrial cancer and appropriate measures taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

PREMARIN® Brand of conjugated estrogens Vaginal Cream

Given cyclically for short-term use only. For treatment of atrophic vaginitis or kraurosis vulvae.

The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible.

Administration should be cyclic (eg, three weeks on and one week off).

Attempts to discontinue or taper medication should be made at three- to six-month intervals.

Usual dosage range: 2 g to 4 g daily, intravaginally, depending on the severity of the condition.

Treated patients with an intact uterus should be monitored closely for signs of endometrial cancer; an appropriate diagnostic measures should be taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

IMPACT OF THE SOLID WASTE CRISIS ON MEDICAL PRACTICES

RONALD COHEN, PH.D., MIDDLESEX*

The solid waste crisis has mandated that physicians in New Jersey counties arrange for the separate disposal of infectious waste. This has posed many unanticipated problems for the medical industry.

A fierce debate is waging over the environmental safety of garbage-burning incinerators as our landfills reach capacity and are closed one after the other.

The economic impact on the general public has made newspaper headlines throughout New Jersey. On August 6, 1987, the New Jersey Board of Public Utilities granted a 227 percent rate increase to the owners of the Edgeboro landfill. In addition, arrangements were made to restrict the use of the landfill to Middlesex County residents. The other counties using this landfill were ordered to develop a plan, subject to the approval of the New Jersey State Department of Environmental Protection, as to how they will get rid of their solid waste. The counties affected had to establish trash transfer stations by January 1, 1988. The garbage is dumped at the transfer stations, where it is loaded onto giant trucks and hauled to landfills in Pennsylvania. This led to another round of rate increases for disposal of our solid waste.

Until December 31, 1987, Morris County haulers were paying \$58.67 a ton to dump at the Edgeboro landfill in East Brunswick. As of January 1, 1988, they had to pay another 93 percent increase on top of the 227 percent granted only five months earlier. Somerset and Union Counties had similar second round increases in disposal costs.

This paper will discuss the details of the impacts on medical practice in Somerset County. However, it should be recognized that other counties, such as Hunterdon, Union, and Morris, face similar dilemmas and eventually, as more and more landfills close, the entire state may be impacted.

Somerset County signed a contract with the Empire landfill in Taylor, Pennsylvania. On January 1, 1988, Somerset County trash was redirected from the New Jersey landfill to the Pennsylvania landfill. The county was notified that the Pennsylvania Department of Environmental Resources has promulgated regulations which prohibit the disposal of pathological or infectious waste in any sanitary landfill in the state.

THE HEALTH INDUSTRY AND SOLID WASTE

Physicians, dentists, hospitals, veterinarians, public health clinics, and nursing homes discovered their garbage haulers would not pick up their waste. The collector/haulers for Somerset County were advised that an entire load with any infectious material would be turned away from the transfer station. Therefore, the physician or other generator would have to sepa-

*Dr. Cohen is Health Officer, Middle Brook Regional Health Commission. Correspondence may be addressed to Dr. Cohen, Middle Brook Regional Health Commission, 1200 Mountain Avenue, Middlesex, NJ 08846.

rate this material at the source or there would be no garbage collection.¹ Any load of waste with infectious material that arrived at the Pennsylvania landfill would be refused dumping rights and redirected to a landfill in West Virginia. The entire load would be redirected, not just the part with the infectious waste.

In Pennsylvania, infectious waste is identified as municipal waste which, prior to processing or disposal, is or may be contaminated by a disease-producing microorganism, or may pose a substantial present or potential hazard to human health when improperly processed, stored, transported, disposed, or otherwise managed.² This term includes, but is not limited to:

1. Wastes generated by hospitalized patients who have been isolated to protect others from communicable disease.
2. Cultures and stocks of etiological agents.
3. Waste blood and blood products.
4. Tissues, organs, body parts, blood and body fluids removed during surgery or autopsy, and other wastes generated by surgery or autopsy of septic cases or patients with infectious diseases.
5. Wastes that were in contact with pathogens in any type of laboratory work, including collection containers, culture tubes and dishes, slides, plates, and assemblies for diagnostic tests; and devices used to transfer, inoculate, and mix cultures.
6. Sharp instruments, including hypodermic needles, suture needles, disposable razors, syringes, pasteur pipettes, broken glass, and scalpel blades.
7. Wastes that were in contact with the blood of patients undergoing hemodialysis at hospitals or independent treatment centers.
8. Carcasses and body parts of animals exposed to zoonotic pathogens.
9. Animal bedding and other wastes that were in contact with diseased or laboratory research animals or their excretions, secretions, carcasses, or body parts.
10. Waste biologicals, e.g. vaccines produced by pharmaceutical companies for human or veterinary use.
11. Food and other products that are discarded because of contamination with etiological agents.
12. Etiologically contaminated equipment and equipment parts which are to be discarded.

Any Somerset County hospital, physician, or other generator of one or more items on this list was required to separate them from the general waste as of January 1, 1988. All health care professionals were notified that they had to contract with a firm that specializes in the removal and incineration of infectious waste.³ The firms that provided this service charged about \$40 to \$50 for the separate pickup. However, in contrast to the multiweek pickup service by the regular garbage haulers, the frequency of pickup of the infectious waste would depend on the volume generated. Somerset physicians were notified they would have only monthly service due to the low volume they generated.

It gradually became clear that the impact of the Pennsylvania regulations for landfill disposal would affect an even wider part of the medical service industry than originally was projected. Thus, on January 20, 1988, all school nurses in Somerset County were notified that they had to provide the Office of Solid Waste Management with certification of a separate contract with a medical waste hauler.⁴

Another idea came to the forefront: autoclave the infectious waste, render it harmless, and then put it out with the garbage, possibly in a separate bag marked that it had been sterilized by an autoclave by a physician. The Somerset County Solid Waste Program ruled this unacceptable. Pennsylvania certifies autoclaves while New Jersey does not. Until New Jersey establishes such a program and arranges an agreement for its acceptability with Pennsylvania, infectious waste will be refused, regardless of whether it has been autoclaved or not.

STATEWIDE IMPACT

The potential for future statewide impact of this crisis has been recognized by our legislators. On November 6, 1987, Senator McManimon prepared bill S-790, entitled, "An Act Establishing the New Jersey Medical Waste Study Commission and Making an Appropriation." The bill listed its purpose as "it is the public policy of this state to encourage the utilization of state-of-the-art waste management techniques in the disposal of medical waste in order to protect the environment."

This dilemma, in part, has encouraged some individuals to try to make solid waste disposal contracts with landfills in other states. Crossridge, Inc., owned by two New Jersey residents, currently is seeking permission from Governor Richard Celeste of Ohio to expand their Jefferson County landfill in eastern Ohio from 150 tons to 1,750 tons a day to accommodate New Jersey trash.⁵ This interest in Ohio as a landfill site may be due to lower costs for the disposal of wastes as compared to other states.⁶ The lower dumping charge may compensate for the increased hauling costs due to the greater distance required for hauling New Jersey trash.⁷

Ohio has established a committee to deal with the issue of interstate dumping of infectious waste and related issues.⁸ The committee concluded that there is no epidemiological or other evidence that public health is adversely affected by current infectious waste disposal practices. They had four recommendations:⁷

1. Careful consideration be given to the costs of further regulations since it is unlikely it will improve or protect the public health.
2. The categories designated by the Centers for Disease Control (CDC) as potentially infectious be adopted as the definition of infectious waste.⁸
3. Any regulations adopted in Ohio cover all generators of infectious medical waste, other than households.
4. The guidelines of the CDC regarding methods to render infectious waste noninfectious be considered adequate. The committee suggested use of steam sterilization, incineration, disposal of blood and body

fluids into the sanitary sewage system, and chemical disinfection/sterilization be included as an adequate alternative to render potentially infectious medical wastes non-infectious.⁸⁻¹⁰

The major difference between the two sets of recommendations is that the United States Environmental Protection Agency and CDC guidelines differ on the standards for handling communicable disease isolation wastes, contaminated laboratory wastes, surgery and autopsy wastes, dialysis unit wastes, and contaminated equipment.

NOSOCOMIAL INFECTIONS AND AIDS

There was only one report noted in the literature describing an infection due to the management of infectious waste.¹¹ The report describes an increase in nosocomial infections in a hospital in Illinois due to a chute-hydropulping waste disposal system. The general community and the waste handlers were not affected.¹¹ However, there are no standards for mandatory reporting and followup of injuries or occupational diseases acquired by workers who handle infectious waste at landfills or transfer stations. Therefore, we cannot conclude that the one case noted is the only one due to occupational exposure to infectious waste.

The prevention of nosocomial infections due to inadequate infectious waste control policies has been recognized by the Joint Commission for the Accreditation of Hospitals (JCAH) and the American Osteopathic Association (AOA). Routine inspections of hospitals by these accrediting agencies include a review of infectious waste policy.¹²

The emotional fear of AIDS and the extensive publicity during the summer of 1987 to the medical wastes floating onto the New Jersey beaches may have sensitized people to an unfounded fear of hazards associated with medical wastes. No cases of AIDS have been traced to swimming in polluted waters or to handling infectious waste by the haulers or workers.^{6,7}

The shifting pattern of disposal of New Jersey's solid waste from in-state to out-of-state disposal will subject the medical care establishment to restrictive legislation of the state in which the sanitary landfill is located. Perceived fears and resulting legislation will attempt to restrict dumping of any out-of-state waste that may have potential to pollute the environment. Prior to July 1, 1987, about 11 percent of the state's

waste was transported to out-of-state landfills. Since that date, Essex, Passaic, Morris, Somerset, Union, Hunterdon, and Bergen Counties have, or are developing, contracts with out-of-state sanitary landfills. When Bergen County ended its dumping at the Meadowlands on February 29, 1988, the out-of-state volume increased to 56 percent of the total New Jersey solid waste output.¹⁴

CONCLUSION

The solid waste crisis is having major potential impacts on the health care establishment. The need to develop adequate guidelines and definitions for the safe handling and disposal of medical wastes is being recognized in New Jersey.¹⁵ It is being brought to the forefront of new issues due to the solid waste disposal crisis and the increased interstate shipment of waste.¹³

**“A fee-for-service insurance program
with complete office coverage?”**

**I don't
believe it.”**

**Believe it!
Medallion.
From Blue Cross and Blue Shield.**

When you asked for a fee-for-service insurance program with comprehensive medical coverage, we listened. Because we all share a common concern, the welfare of your patient.

And when you told us fee-for-service had to cover all your in-office claims, we heard you.

Together we've developed Medallion, the best insurance for a healthy practice—and your patients.

Comprehensive fee-for-service.

The insurance program you want with the comprehensive medical coverage your patients need, including office visits, well child care and unlimited laboratory and X-ray services. Just bill your usual charges for each and every service you perform.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice

AN INTERVIEW WITH MOLLY JOEL COYE, M.D., PUBLIC HEALTH COMMISSIONER

LINDA JANET HOLMES, M.P.A., EAST ORANGE*

In an interview, the commissioner of health discusses key public health issues and briefly comments on future personal plans and the responsibility of women achievers to remain sensitive to barriers that many professional women still encounter.

At age 27, Molly Coye entered Johns Hopkins University School of Medicine. She received her medical degree and master's degree in public health in 1977, and was board certified in preventive medicine and occupational medicine in 1982. At the University of California-San Francisco, Dr. Coye completed her internship in the San Francisco General Hospital-Family Practice Program and her residency in the Department of Medicine as a Robert Wood Johnson Foundation clinical scholar. She served on the medical staff of the University of California-Berkeley Labor Occupational Health Program during her residency and, from 1979 to 1984, was chief of the Occupational Health Clinic at San Francisco General Hospital.

Prior to joining the New Jersey State Department of Health as deputy commissioner in 1986, Dr. Coye served as special advisor for health and environment in Governor Thomas Kean's Office of Policy and Planning. She developed programs addressing state health problems in three important areas: maternal and child health, the elderly, and occupational and environmental hazards.

Among many professional activities, Dr. Coye has been a leader in the American Public Health Association, as head of the Action Board from 1984 to 1985 and as a member of the Executive Board since 1985. She is affiliated with the New Jersey Public Health

Association, the American College of Preventive Medicine, the Society for Occupational and Environmental Health, and the National Association for Public Health Policy. Dr. Coye also is chairperson of the Advisory Committee to the Graduate Program in Public Health at UMDNJ—Robert Wood Johnson Medical School and Rutgers, the State University of New Jersey, and a clinical professor at the medical school.

Holmes: As commissioner of health, do you feel you have been able to keep your social change spirit alive?

Coye: First, very genuinely, Governor Kean has been tremendously supportive, when I was an adviser in the State House and when I've been commissioner. He basically has supported all of the significant public health goals that I've wanted to set forth in programs. He has made new funding available for several major areas. He has communicated to his staff in the State House expectations of the same degree of support. In my discussions with health commissioners in other states, I have a strong impression that I am very lucky; I have been granted both a great deal of latitude and specific support.

A second piece which is very important is that there is a staff in the Health Department that shares these

*Ms. Holmes is affiliated with the New Jersey Department of Health, Trenton. Correspondence may be addressed to Ms. Holmes, 64 Cambridge Street, East Orange, NJ 07018.

Figure—Commissioner of Health Molly Joel Coye, M.D.

public health ideals in a specific and professional sense, and they are working to achieve social change in a broad sense. Of course, they have expertise in various areas. Frequently, my role is to organize support in terms of funding and getting regulations or legislation passed so that they can do what they might have wanted to do for a long time; that's very different from me thinking up all the ideas and then having to do it alone. If I did not have good staff in so many different areas, there would be a real limit to how much I could achieve.

Thirdly, I do not know if this is an accurate self-perception, but I think that attempting to do as much as I can in a nonconfrontational way is effective in increasing how much movement occurs in each direction.

Holmes: During your administration as commissioner, what are the priority areas that have been identified for public health?

Coye: In the area of uncompensated care—indigent care—we are the only state in the country that pays 100 cents on the dollar for the care of any person who does not have health insurance. Whether they are getting ambulatory care in a clinic or whether they are staying overnight as an inpatient, the patient's care is covered through this system called uncompensated care. There are only four or five other states that have a system that pays for health care for the indigent. These states only pay 60 to 70 percent of the cost, and there is much less of an incentive for hospitals to want to provide for indigent patients.

A study done by the Robert Wood Johnson Foundation last year compared access to care for people who do not have health insurance in New Jersey with other

indigent populations in the nation. This study showed that access to care, satisfaction with care, and perception of economic barriers on the part of minorities were significantly better by all measures in New Jersey. To me, that is very important validation that our system does work. While admittedly there still are significant problems even when the economic barriers to discrimination are removed, the social and political kinds of barriers often remain. This accomplishment in the area of uncompensated care is not mine by a long shot: the system was developed in 1979-1980, but it was in some danger of collapsing when I came in as commissioner. We passed new legislation in January 1988, which established a pool—a trust fund—to finance the care for the indigent. Again, this is very important to me and I feel very good about the accomplishment.

A second area of accomplishment is HealthStart. I think the idea of building into an entitlement program access to the full professionally recommended range of services by the American Academy of Pediatrics, the Institute of Medicine, and the American College of Obstetrics and Gynecology really is quite a path-breaking idea. So many of these programs in the past have been done through grants to small subsectors of the population. The idea that it is precisely the people who are poor who have the most need of the full range of recommended services and also are the least likely to get them, is something that really should be confronted directly. I hope HealthStart will be a model for the country.

The third priority area is AIDS. I think New Jersey has the toughest battle of any of the states that has a major AIDS burden because it is so predominantly

intravenous drug related. It has not proved to be easy, but it certainly is much more feasible to change the behavior of "gays" who are at risk than IV drug users. If you think about how many decades we have tried to fight the battle against drug abuse, you know how hard that is on its own terms. I think we have developed some innovative models such as the coupon program and ex-addict counsellors. Yet, we have not been able to go the distance. What really needs to be done is to have massive programs to get drug addicts out of addiction. Certainly, compared with other states, we have nothing of which to be ashamed. Nationally, only about 15 percent of heroin addicts are in contact with a system—receiving services at any time. We still are reaching only about 20 percent of the addicts. If we want to stop AIDS, we must find a way to massively reduce the number of people who are addicted. This is our biggest stumbling block.

The fourth priority area is in occupational health and safety and environmental health. In that area, we have a project called Project Teach where we are attempting to work directly with communities, unions, and other worker groups to try to resolve their concerns about health in the communities. In the past, a public health official would come to an auditorium and give a speech which might be designed primarily to give the public the message, "Don't worry, everything will be o.k." Other times, officials might have explained problems in very technical language which might have caused some people to be quite concerned or ill at ease. What we are trying to do is send in groups of health educators who actually can work with the local health officials and the community or worker groups to define what their concerns are, to figure out how to present the information in a way that will be helpful, and to make sure they understand the options that are available to them in trying to resolve a situation. We think this is a much better model of how public agencies should work with communities. This is true, not only for environmental health, but in other areas as well. It is less of a missionary or didactic kind of position and more of a participatory model.

Holmes: When you were in the Clinical Scholars Program at the Robert Wood Johnson Foundation, you spent some time thinking and writing about structuring conferences that actually involved participants who were the subjects of the research in the planning activity. Have you had an opportunity to use any aspects of that approach in the real world of public health?

Coye: I think that Teach and also the Teen Pregnancy Hearings were good examples of how that kind of approach can be very effective. For example, one of the things that the teens themselves expressed was support for alternative schools for pregnant women.

There has been a great deal of debate about whether these schools should be mainstream or separate schools. It is important to find out what people themselves think.

The fifth priority area for the department probably is more esoteric than you would want to get into for this article. It is reimbursement reform for the hospitals and is a rather complex issue.

Holmes: Where do you see yourself ten years from now?

Coye: I did not see myself here ten years ago, so I do not know how valuable that question is. I used to do a lot of international public health work, and at some point, I would like to return to it. I am very interested in international health and I did a lot of work in Latin America in particular, so that is a possibility.

I also find myself very much interested now in issues of access to health care, indigent care, and maternal and child health, which really is not my background. My background was occupational and environmental health, but I find it very satisfying to work on programs where you have such a rapid payoff as you do in maternal and child health. To me, indigent care seems to be one of the most pressing national problems, and it also is very satisfying to be able to feel that you are actually having an impact in that area. Therefore, I might continue to work in a policy or administrative job somewhere else.

Holmes: Could you comment on the importance of women willing to obtain positions of power. What psychological makeup is required to sustain those positions of power without fear?

Coye: There are all kinds of theories about what your family was supposed to have been like in order to produce children within certain molds. My family was tremendously supportive. They always encouraged me to be very experimental, to take on challenges that many other parents would not have allowed their children to do. They had a lot of confidence in me and were very interested in the work I did. Unlike some women who have struggled against tremendous adversities in order to reach positions of power, it simply did not occur to me that I should not do something or that there would be any question about whether I would be allowed to do something.

When I went to Hopkins and tried to start a women's group at the medical school the first year, the reaction of many women was "Why, we do not feel any discrimination against ourselves." But, intellectually, we must look at the patterns around us and recognize that many other people have a very rough time, and try to remove those barriers so that everyone has a shot at it, rather than just those people whose families gave them support.

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

A MISLEADING CERVICAL BRUIT IN CAROTID OCCLUSION

WILLIAM J. MULLALLY, M.D., STEWART J. TEPPER, M.D., THOMAS M. WALSHE, III, M.D.,
AY-MING WANG, M.D., MARTIN A. SAMUELS, M.D., PRINCETON*

The clinical usefulness of a carotid bruit is limited. In an asymptomatic patient with a carotid bruit, one cannot assume that carotid stenosis is present. Furthermore, asymptomatic carotid stenosis does not necessarily require treatment.

Auscultation of the neck, over the carotid artery at the angle of the jaw, is part of the routine physical examination. Noises in the areas overlying the carotid bulb allegedly provide useful information concerning the anatomical or pathological status of the carotid artery; murmurs heard from this area are considered to be among the best clinical evidence for the presence of atheromatous involvement of that artery.¹⁻⁵ When a loud and well-localized bruit was heard over the carotid region, Rennie and colleagues found that arteriography confirmed a stenosis in approximately 75 percent of patients.⁶ The genesis of such sounds is related to the disruption in laminar flow by irregularity of the vessel wall and by a reduction of the cross-sectional area. Absence of a bruit may indicate a normal or completely occluded vessel while disappearance of a bruit is consistent with the development of complete occlusion of the artery.^{1,7}

We observed and treated a patient who had a loud cervical systolic bruit and complete occlusion of the common carotid artery.

CASE REPORT

Six years prior to admission to the West Roxbury Veterans Administration Hospital, a 60-year-old man with a long history of hypertension presented with repeated episodes of transient monocular blindness

involving the left eye. An arteriogram revealed a high-grade stenosis of the left internal carotid artery just above the bifurcation and an endarterectomy was performed. He suffered a stroke in the distribution of the superior division of the left middle cerebral artery during the procedure and was left with a right hemiparesis and mild aphasia. The weakness improved over a period of several weeks and he remained stable. Subsequently, he again experienced loss of vision in the left eye lasting five minutes. There were no localizing hemispheric symptoms.

On admission to the West Roxbury Veterans Administration Hospital, vital signs were normal. Physical examination revealed a scar over the left carotid. There was a high-pitched, high-intensity (grade 3/4) non-radiating holosystolic bruit at the angle of the jaw on the left. No bruit was heard over the ipsilateral orbit or elsewhere and there were no cardiac murmurs. Neurologic examination of the patient revealed a mild right hemiparesis with hyperreflexia, mild anomia, and a right Babinski sign.

*Dr. Mullally is affiliated with the Department of Medicine, The Medical Center at Princeton. Drs. Tepper, Walshe, Wang, and Samuels are affiliated with the Departments of Neurology and Radiology, Harvard Medical School, Boston, Massachusetts. Correspondence may be addressed to Dr. Mullally, 11 State Road, Suite 200, Princeton, NJ 08540.

Figure—Arteriogram showing the stump of the right vertebral artery (small arrow head); the stump of the left common carotid artery (large arrow head); and the left vertebral artery (middle-sized arrow head).

Routine CBC, SMA12, electrocardiogram, and chest x-ray were normal. Phonoangiography confirmed the presence of the murmur. A cerebral arteriogram revealed complete occlusion of the left common carotid artery near its origin and a widely patent right carotid artery. An ulcerated plaque was identified in the distal portion of the right common carotid artery. There was no cross-filling from the right carotid to the left anterior and middle cerebral arteries. Occlusion of the right vertebral artery also was noted (Figure).

DISCUSSION

Arterial murmurs are caused by changes in the vessel wall, abnormalities of the biophysical characteristics of blood, increase in flow, or a change in the pressure gradient across a stenosis or through a fistula.⁸ Bruits are transmitted along the artery in which they arise at approximately the speed at which the pulse wave travels.⁹ Stenosis from atherosclerosis is the most frequent pathologic cause of aorto-cervico-cranial murmurs. The common sites of atherosclerosis include the origins of the brachiocephalic artery; the left common carotid and the left subclavian arteries from the aortic arch; the vertebral artery origin; the bifurcation of the common carotid artery; and the region of the internal carotid siphon.¹⁰

Not all murmurs are pathologic, especially in young persons. Attempts have been made to characterize

murmurs in the neck using auscultatory criteria and, on this basis, to accurately determine the etiology.^{11,12} Excess pressure against the neck with the stethoscope may obliterate or accentuate the sounds.¹³

High-pitched, long duration bruits, as were found in our patient, usually are associated with stenosis. The tightest stenosis is said to produce a murmur which may continue into diastole. The bruits of stenotic vascular disease are difficult to separate from bruits which arise from benign physiologic or anatomic conditions. Although the criteria are not altogether clear, certain characteristics are reported to be helpful. Longer, lower-pitched murmurs which characteristically continue into diastole are associated with high velocity flow seen in anemia and high cardiac output, but not stenotic vascular disease.^{4,8} Venous hums are noises usually heard on the right side, low in the neck, and more apparent in the erect position when venous return is accelerated. They are prominent during diastole and can be obliterated by compressing the external jugular vein.

The point of origin, maximum intensity, and transmission characteristics are helpful in ascertaining the cause of a cervical murmur. A murmur over the eye may suggest ipsilateral internal carotid stenosis.^{2,8}

Further analysis of cervical bruits can be made with noninvasive techniques. Spectral phonoangiography has been shown to be highly reliable in predicting the carotid artery residual lumen in patients with carotid stenosis as compared to contrast angiograms and surgical specimens.¹⁴ However, such techniques have not been verified adequately for analysis of all patients presenting with bruits. Noninvasive techniques, when applied to bruits due to augmented circulation through patent vessels of the kind presented in our case, have an unknown degree of sensitivity and specificity.

Even if physiologic murmurs can be reliably excluded, the remaining pathologic murmurs do not all indicate internal carotid stenosis. Bruits heard over the branches of the external carotid arteries sometimes indicate disease in the internal carotid system, but in themselves do not represent markers for high stroke risk.¹¹ Fisher described several murmurs (augmentation bruits) reflecting disease outside the arteries being auscultated.¹⁵ A bruit may be heard in the carotid artery opposite the one occluded, presumably from the increased velocity with which blood must flow in order to supply its normal territory as well as a portion of the other hemisphere. When the internal carotid artery above is entirely occluded, a murmur may be heard in the area of the bifurcation of the common carotid artery. This is thought to be related to a relative narrowing at the origin of the external carotid artery. Finally, a vertebral bruit may be heard from the supraclavicular fossa to the mastoid region posterior to the usual location of the carotid artery. This bruit may be misinterpreted as originating in the carotid, but has been found in patients with bilateral carotid occlusions, subclavian steal, and hemangioma of the brain stem.^{2,15}

COMMENT

Our patient presented with a transient ischemic event in the distribution of the left internal carotid

artery. Examination revealed a bruit whose pitch, duration, and amplitude seemed indicative of internal carotid artery stenosis. The arteriogram, however, showed no flow of blood through either the internal or external carotid system on the left. In addition, there was occlusion of the right vertebral artery. The noise heard apparently represented an augmentation bruit of the left vertebral artery which followed the occlusions.

Because of the difficulty in separating physiologic and nonlocalizing bruits from those which are indicative of stenosis, the clinical usefulness of a cervical bruit is limited. When transient neurological deficits occur with or without a bruit, it is important to visualize the carotid system to diagnose stenosis or ulcerated plaque. A bruit alone, indeed, may not always indicate an underlying vascular lesion in the artery, as in this case.

Moreover, asymptomatic carotid bruits in which stenosis is proved at angiography or suggested by phonoangiography do not necessarily require treatment. The natural history of untreated carotid stenosis is not known.¹⁶⁻¹⁸ Even in the presumably high-risk patients who undergo major cardiovascular surgery with known carotid stenosis, the presence of an asymptomatic carotid stenosis does not necessarily predispose them to perioperative stroke.¹⁹

STATE OF THE ART: CURRENT STATUS OF BREAST IMAGING

MARK T. DiMARCANGELO, D.O., CAMDEN*

One of the major indications for mammographic imaging is for surveillance of breast parenchyma for malignant changes which are clinically occult. This article deals with the status of mammography as a screening tool, as well as its other applications.

Carcinoma of the breast maintains its prevalence as the most common malignancy affecting women.¹ Early detection of this clinical entity has become a mandate for today's medical practitioners. Multiple statistical studies have been designed to elucidate the value of early detection programs for breast cancer.

THE VALUE OF EARLY DETECTION

During the 1960s, the Health Insurance Plan of New York conducted a prospective study in which they compared one population of women who underwent annual mammographic examinations and breast palpation with a second control population who only underwent routine health care. The study concluded that there was a significant decrease in mortality of the study group versus the control group.²

In the 1970s, the Breast Cancer Detection Project was carried out as a national multicenter study in which over a quarter of a million women were evaluated with clinical and x-ray examinations.³ This study revealed that x-ray mammography uncovered a statistically significant number of breast carcinomas which were not evident on clinical examination.

IMPORTANCE OF LOW-DOSE MAMMOGRAPHY

In the 1960s and early 1970s, relatively high radiation doses were delivered to the breasts during mammography. The doses were on the order of 1 to 2 rads per exposure. Since at least two radiographic projec-

tions to each breast were performed, this resulted in an approximate total exposure of 2 to 4 rads per breast. With this information, controversy arose regarding the safety of mammography for early detection of breast malignancy, since it was theorized that high-dose mammography could itself be a carcinogen.

Since 1976, the Food and Drug Administration (FDA) has been measuring mammographic radiation exposures at multiple clinical installations nationwide.⁴ In the past ten years, there has been a substantial decrease, on the order of 50 percent, in total dosage to the breasts. Many technical factors are responsible for the current state-of-the-art, low-dose mammographic systems including technological advances, improved film-screen combinations, phototiming devices, and compression equipment.

Modern mammographic units yield doses on the range of 0.05 to 0.5 rads per exposure. These relatively low radiation doses imply that there is a good risk-benefit ratio in the use of x-ray mammography as a screening examination.

GUIDELINES FOR SCREENING MAMMOGRAPHY

The American Cancer Society in conjunction with the American College of Radiology and other pro-

*Dr. DiMarcangelo is Attending Radiologist, Cooper Hospital, and Clinical Assistant Professor of Radiology, UMDNJ-Robert Wood Johnson Medical School. Correspondence may be addressed to Dr. DiMarcangelo, Cooper Hospital/University Medical Center, Camden, NJ 08103.

professional organizations recommend the following guidelines in the implementation of mammography for breast cancer screening of asymptomatic women: 1. a baseline study at age 35; 2. women who are between the age of 40 and 49 should have a mammogram every one to two years; and, 3. over the age of 50, annual mammographic examinations are advised.

THE ROLE OF THE CLINICIAN

Referring physicians must be aware of the capabilities of the imaging facility in order to provide the optimal screening examination.⁴ Primarily, it is imperative that the radiologist and technical staff receive adequate training in the acquisition and interpretation of mammographic images. Additionally, one should ascertain that the facility is utilizing dedicated low-dose mammography technology which generates top-quality diagnostic images. The equipment should undergo periodic assessment by a health physicist, and it should meet present low-dosage requirements.

The referring clinician plays a key role as an educator and should provide factual information to patients. Outlining the mammographic procedure with patients prior to the actual study can be efficacious in allaying anxieties and dispelling any unrealistic notions.

METHODOLOGY

During the examination, the patient stands; each breast is compressed by a mechanical contrivance in the horizontal direction for the craniocaudal projections and in a semi-vertical fashion for the mediolateral oblique projections. (The radiologist may elect to add other views to the study.) During the compression of the breast, there may be discoloration and some discomfort of the breast. It is quite important to attain optimal compression since this "spreads out" the breast parenchyma allowing better visualization of any underlying breast lesions. Adequate compression also results in a lower absorbed dose of radiation to the breast. During the few seconds of the compression, the x-ray technologist stands behind a shield and makes an exposure; the compression on the breast is released immediately after exposure. The patient should be reassured that no major untoward effect will be rendered by mechanical compression of her breast. Any discomfort to the breast in the postmammographic period will be shortlived, but may be treated symptomatically with aspirin or acetaminophen. Maximal breast tenderness usually occurs just prior to the onset of menses; the scheduling of mammography can be made for the time following the cessation of the menstrual period.

LIMITATIONS AND ADVANTAGES

Although mammography is highly effective in early detection, it should be realized that this modality has limitations. A negative mammogram cannot completely exclude the presence of a carcinoma. Therefore, an unrevealing mammogram should not negate the indication for biopsy of a clinically detected abnormality. Mammography has a good sensitivity in regards to detection of lesions, however, its specificity with regards to diagnosis is relatively low. It should be stated

clearly that the only true diagnostic modality for breast lesions is histological evaluation of aspiration and biopsy specimens.

The radiologist plays a pivotal part in ascertaining the need for a breast biopsy. There are a finite number of benign entities recognized mammographically and they have been dubbed "leave alone" lesions.⁵ This category includes benign calcifications, dermal lesions, lipomas, and intramammary lymph nodes. Other entities may be indeterminate and are placed in a "probably benign" category. In this case, the radiologist defers the biopsy and elects to follow the lesion over a certain interval for further characterization.

NONMAMMOGRAPHIC BREAST IMAGING

Presently, other imaging modalities have not proved to be effective in early detection of breast cancer.⁶ Ultrasound has proved useful in cyst/solid differentiation of lesions and also as a guide for cyst aspiration. Ultrasound is used only after detection of a lesion by mammography and/or palpation.

Computed tomography (CT) may be used in complicated cases where mammography for needle localization of a lesion prior to surgical biopsy has been ineffective. CT is especially helpful in identifying lesions close to the chest wall.

The other modalities available to the practicing radiologist presently are not helpful in detection or diagnosis of breast cancer and are considered experimental at best. Thermography has been shown to have very high false-positive and false-negative rates. Diaphanography or transillumination light scanning has poor sensitivity and specificity. Magnetic resonance imaging (MRI) at this time is an investigative technique. Radiologists are on the upslope of the learning curve with regard to MRI. So far, present MRI technology does not appear to offer any primary or adjunctive uses in breast imaging.

CONCLUSION

Guidelines have been determined for the use of mammography in screening of the female population for occult early breast carcinomas. Mammography also is recommended for: evaluation of clinically detected lesions; detection of synchronous clinically occult tumors in the ipsilateral or contralateral breast; and presence a benign or "probably benign" lesion. Mammography is implemented in needle localization of nonpalpable lesions prior to surgical biopsy.

**“A big insurance company
that’s really listening to me?”**

**I don’t
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we’ve developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you’ll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We’re eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey’s medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate with Blue Cross and Blue Shield.

If you’re not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Call 1-800-842-BLUE for more information. Of course, there’s no obligation.

The best insurance for a healthy practice.

MEDICAL HISTORY: DEFIBRILLATION FLAMBÉ

VICTOR PARSONNET, M.D., NEWARK*

The author's laboratory experience notes an exciting event in medical history; and the author reports the success of his work.

One day in 1962, I made history and didn't know it—until 26 years later. After temporary transvenous pacing was first initiated by Furman and his associates, we began to use a transvenous wire for temporary pacing in every patient who was being prepared for subsequent transthoracic implantation of a permanent pacemaker. We used one that had been adapted from a model loaned to us by Dr. Charles Kossman, with two platinum-iridium electrodes 1 cm apart at the tip of the lead. By that time, we had completed several studies on transthoracic AC and DC defibrillation, and already had described an inhospital "Dr. Pacemaker" emergency call system for sudden death;¹ it was the predecessor of the present-day cardiopulmonary resuscitation programs, now called "Code 1," "Code Blue," or some such poorly disguised bell over the hospital paging system.

With my research associates, Drs. George Myers, Gerhard Lewin, and I. Richard Zucker, I was studying transvenous pacing in the dog laboratory. Based upon our prior experience, it seemed an obvious next step to try to defibrillate the heart transvenously. We knew how much energy was required, approximately 40 joules, and took some time to find a way to deliver that much energy with a proper waveshape. Eventually, we settled on a Medtronic laboratory pulse generator that drove a MacIntosh audio amplifier someone had found in his storeroom.

After anesthetizing a dog, I introduced the lead into the right ventricle and induced ventricular fibrillation

(VF) with a long burst of AC. After 15 seconds of fibrillation, we fired the MacIntosh amplifier across the bipolar lead. There was a loud, sharp snap, smoke everywhere, and a smell of ozone and burnt flesh. The heart was not defibrillated, and by the time we had recovered our equilibrium, the dog was lost.

The lead was disrupted near the proximal electrode as if there had been a small explosion, presumably because the current far exceeded the capacity of the lead. The right ventricular surface of the interventricular septum had a burn 2 cm in diameter.

We concluded at that time that transvenous defibrillation was not possible. We now conclude that we were the first to perform (unsuccessful) transvenous defibrillation, and the first to perform endocardial ablation of whatever it was we had cooked.

Note: We have just learned how to do it successfully.²

Limbitrol® (N)

Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, nervousness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: **Cardiovascular:** Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke. **Psychiatric:** Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. **Neurologic:** Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. **Anticholinergic:** Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. **Allergic:** Skin reactions, urticaria, photosensitization, edema of face and tongue, pruritus. **Hematologic:** Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. **Gastrointestinal:** Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue. **Endocrine:** Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Other:** Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

CLINICAL NOTE: CHEMICAL DEPENDENCY AND THE FAMILY

JOHN J. VERDON, JR., M.D., TINTON FALLS*

Alcoholism and chemical dependency are escalating diseases. Collaboration with the family, Alcoholics Anonymous, Narcotics Anonymous, and treatment centers is imperative. The physician should remain actively engaged with the patient and the family throughout the course of treatment.

The approach to the disease of chemical dependency must be simple. At the time of the initial evaluation, a number of factors must be considered. Of paramount importance, however, is the general medical condition of the presenting patient and the need for management of withdrawal in a controlled, therapeutic setting. Significant factors that dictate admission to such a center include, but are not limited to: the presence of tremors of the hands and, in particular, of the tongue; daily intake of large quantities of alcohol (160 gm/16 oz/day); and the history of seizures or episodes of delirium tremens during previous attempts to achieve abstinence. In general, the use of alcohol combined with other hypnotic agents, or the repetitive use of hypnotic agents in a daily dose estimated to be greater than the equivalent of 400 mg of pentobarbital per day, indicate the urgency of hospitalization for withdrawal management. Although many patients do not suffer major symptoms of abstinence, their compulsion to use is such that a protective therapeutic environment is essential to begin the recovery process. Confrontation can be achieved effectively when the patient feels most vulnerable, while at the depth of his despair, and is most amenable to the concept of "surrender."

Those patients who appear on an urgent basis to the emergency room of a general hospital often are ad-

mitted at that point in time for safe withdrawal from their mood-altering substances including alcohol and other agents. The vast majority of such patients employ more than one substance. Age seems to be a consistent predictor of the substances the identified patient indicates as the drug of choice. The most common substances abused by persons seen in clinical practice today are alcohol, cocaine, opiates, and marijuana. It is striking that the majority of patients do not believe they have "lost control" over all these agents, but are of the opinion that only a specific substance is presenting problems at one point in time. As indicated, most of the individuals require a medical facility for the treatment of the abstinence syndrome. Unfortunately when this process is completed, most patients wish to return rapidly to the community and reject the notion that they must embark upon recovery in a controlled therapeutic environment.

If the patient contacts the practitioner in his office, an evaluation should be conducted as soon as possible. After performing a careful psychiatric examination and overall health assessment, a working diagnosis is

*Dr. Verdon is Associate Attending Psychiatrist, Riverview Medical Center, Red Bank, and a consultant psychiatrist for the Monmouth Chemical Dependency Treatment Center and Pathways, Inc. Correspondence may be addressed to Dr. Verdon, 712 Sycamore Avenue, Tinton Falls, NJ 07701-4991.

formulated. If the patient does not appear to be afflicted with complicating psychiatric illness, he can begin recovery with the assistance of an appropriate self-help group. Experience advises that additional appointments be scheduled with the physician to monitor the patient's progress. It is imperative that family members be evaluated by the practitioner so that an accurate assessment can be completed and that those codependents can be directed for treatment of their own issues. Based upon the response of both patient and family, the treatment plan may be modified as indicated.

If psychiatric examination reveals evidence of emotional illness, an attempt to engage the patient in a supportive psychotherapeutic process is appropriate. Concomitantly, patient and family are referred to the appropriate self-help group. Neuroleptic medications may be indicated in treatment of "double-trouble" patients, e.g. lithium for bipolar patients; imipramine for panic disorder. The combination of major depressive illness and chemical dependency warrants hospitalization in a psychiatric facility so that an attack can begin on both problems. If vegetative signs of depression persist after safe withdrawal from the offending chemical substances, one must seriously consider the introduction of antidepressant medication. However, dysphoria is so ubiquitous in early sobriety one is hesitant to use pharmacological approaches initially. Adequate rest, nutrition, and vitamin supplementation (in particular, folic acid and thiamine) are indicated. "Recovery sensitive" psychotherapy often is extremely beneficial. However, it must be made clear between the therapist and the patient that the recovery process be an uncomplicated one. The focus lies not on analyzing the reasons for "the use of the mood-altering substances" but in dealing with those barriers to recovery.

***After performing a careful
psychiatric examination
and overall health
assessment, a working
diagnosis is formulated.***

Residential as well as outpatient treatment centers prove most helpful in aiding the patient to confront his denial. In addition, those centers help bring the family into treatment. Frequently, patients and codependents who seek office therapy are highly resistant to other help. In determining the necessity of residential treatment at the onset of recovery, the assessment of the intensity of denial is a key factor. Those who are "reluctant to recover" are most in need of starting recovery in a setting removed from the stresses of the workday life. It is imperative that the family be involved in treatment while the patient is in residence. Those programs that mandate this, and offer a quality family program attached to the facility,

warrant high marks. Although it is ideal for the patient to be treated within easy reach of his home community, the major issues that must be dealt with are the denial of his own illness and the need for continuing treatment on a "one day at a time" basis after discharge. Aftercare/alumni groups do prove beneficial.

However, the task of all "professional treatment" is to deal with the patient's resistance; entrance into the 12-step recovery programs of Narcotics Anonymous and Alcoholics Anonymous as well as family treatment in Al-Anon and Nar-Anon are important. Issues dealing with both psychodynamic formulations and parental alcoholism (with the myriad problems which it fosters for the adult child) must await intensive treatment of the primary chemical dependency and a commitment to sobriety. While it is true that many patients with adult-child issues and other significant psychodynamic factors may relapse if these matters are not addressed, recovery must be firmly established, confronting the reality of today before the past is probed. The process of exploratory psychotherapy is hardly simple and runs counter to the imperative guideline of recovery, i.e. keep it simple.

DISPOSA-PHONE

The Patient "Take Home"
Telephone System That Helps
Stop The Spread Of
Communicable Diseases By
Eliminating
Cross-Contamination And
Improves Your Profit Through
Cost Containment

Avoid telephones that need to be constantly cleaned, repaired or replaced and turn patients' health and well-being into a new profit center by utilizing DISPOSA-PHONE.

Included in patients' admission kit, the lightweight DIS-POSA-PHONE is a single unit phone with a 14-foot retractable cord, tweeter ring and off/on switch. It has true "Touch-tone" technology and carries a one year factory warranty.

The DISPOSA-PHONE, when used at home with your logo imprint, phone number and marketing message, is a constant reminder of where the patient received his special health care.

Cut your costs, liabilities and headaches while increasing your profits and marketing awareness. Call International Telephone, Inc.'s nationwide DISPOSA-PHONE network representative, William Smart now for your free demo and profit analysis, at (201) 387-7767.

A NEW H₂ Antagonist

AXID[®] 300mg

nizatidine

Effective once-nightly
duodenal ulcer therapy available in a
Unique Convenience Pak
for better patient compliance

AXID[®] nizatidine capsules

Brief Summary. Consult the package insert for prescribing information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients, at a reduced dosage of 150 mg b.i.d. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H₂-receptor antagonists.

Precautions: General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy with nizatidine.

Drug Interactions—No interactions have been observed between Axid and theophylline, chlorazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high dose males compared to placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement

compared to concurrent controls, and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive, and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery is not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, and the mouse lymphoma assay.

In a two-generation, perinatal and postnatal, fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose, and in Dutch Belted rabbits at doses up to 55 times the human dose, revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Nizatidine is secreted and concentrated in the milk of lactating rats. Pups reared by treated lactating rats had depressed growth rates. Although no studies have been conducted in lactating women, nizatidine is assumed to be secreted in human milk, and caution should be exercised when nizatidine is administered to nursing mothers.

Pediatric Use—Safety and effectiveness in children have not been established. **Use in Elderly Patients**—Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among the more common adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to

determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT (AST), SGPT (ALT), or alkaline phosphatase), occurred in some patients possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L), and in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic—Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H₂-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine than in placebo patients. Rash and exfoliative dermatitis were also reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported.

Overdosage: There is little clinical experience with overdosage of Axid in humans. If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous LD₅₀ values in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

COMMENTARY: COUNTY JOURNAL ANNIVERSARY

MARY G. ROEBLING, TRENTON*

The author writes about her wishes that scientific and lay publications help the public better understand the price young people pay to become physicians and the price doctors pay to render service.

I believe I can say that most physicians are touched by the divine. I say this strictly as a lay person, not as a member of the medical community in any way, but as an individual who has relatives who are physicians, and who has had many years of experience with doctors. Indeed, doctors have saved my life several times.

Try as I might, I can think of no other profession whose members give so much of themselves as a normal part of their day and who make so many critical contributions to the well-being of individuals and of society—again, as a normal part of their day.

Increasingly in recent years, it has become fashionable to attack the medical profession generally, and physicians in particular. The number of so-called malpractice suits has skyrocketed so that the cost of malpractice insurance is almost out of sight for the average doctor.

In this regard, one problem with the American people—many of them—is they do not realize just how incredibly fortunate they are:

1. To live in a nation which not only permits but encourages free enterprise in medicine and which, at the same time, maintains strict controls on its practice;

2. To benefit from a medical profession with the world's highest standards in training, research, and practice;

3. To benefit from a system providing an adequate number of doctors, in general terms, for the entire population; and

4. To benefit from a system providing service and research in every known biomedical discipline and subspecialty and in every specialty and subspecialty.

If the reader should have any questions about this, he or she should look at the statistics on the thousands of foreign medical students trying to get into American schools every year, and at the thousands of trained foreign physicians trying to move into the United States to practice here.

Part of the strength and versatility of the American medical system comes from its hundreds and hundreds of county medical groups, like the Mercer County Medical Society. And one of the reasons is medical communications. Scientists all over the world are carrying out research on thousands of medical projects crucial to our health and to the health of our children and our grandchildren. The result? Well, the National Library of Medicine in Washington estimates that the world medical literature is growing at a rate of probably ten million pages every year. That's nearly 300 books, of a thousand pages each, every day.

Take just one-tenth of that, or about three books a day. Do you, or does your physician or any physician

*This essay was published in the 20th anniversary edition of the journal of the Mercer County Medical Society.

the reader may know, have time to read even one book a day? Certainly not. In their dedication to their pa-

tients, the doctors are on the run from morning until night, and into the night.

So while it's impossible for the physician to keep up with every new advance in medicine, it is very important for them to have regular opportunities to talk with their colleagues. Medical societies provide this opportunity. More, associations like the one in Mercer County are in a position to invite speakers on subjects such as new pharmaceuticals, new treatment procedures, and new surgical techniques.

(And, by the way, it is obvious that any physician not a member of his county society is missing an opportunity to provide better service to his patients.)
